
An Illinois minister announced on last Sunday night's bulletin: "The funeral of Judas Iscariot." To which an obliging fellow added: "Friends of the deceased are cordially invited."

"Mamma," said little Nell, "ought Governess to flog me for what I've not done?" "No, my dear; why do you ask?" "'Cause she flogged me to-day when I did'nt do my sums."

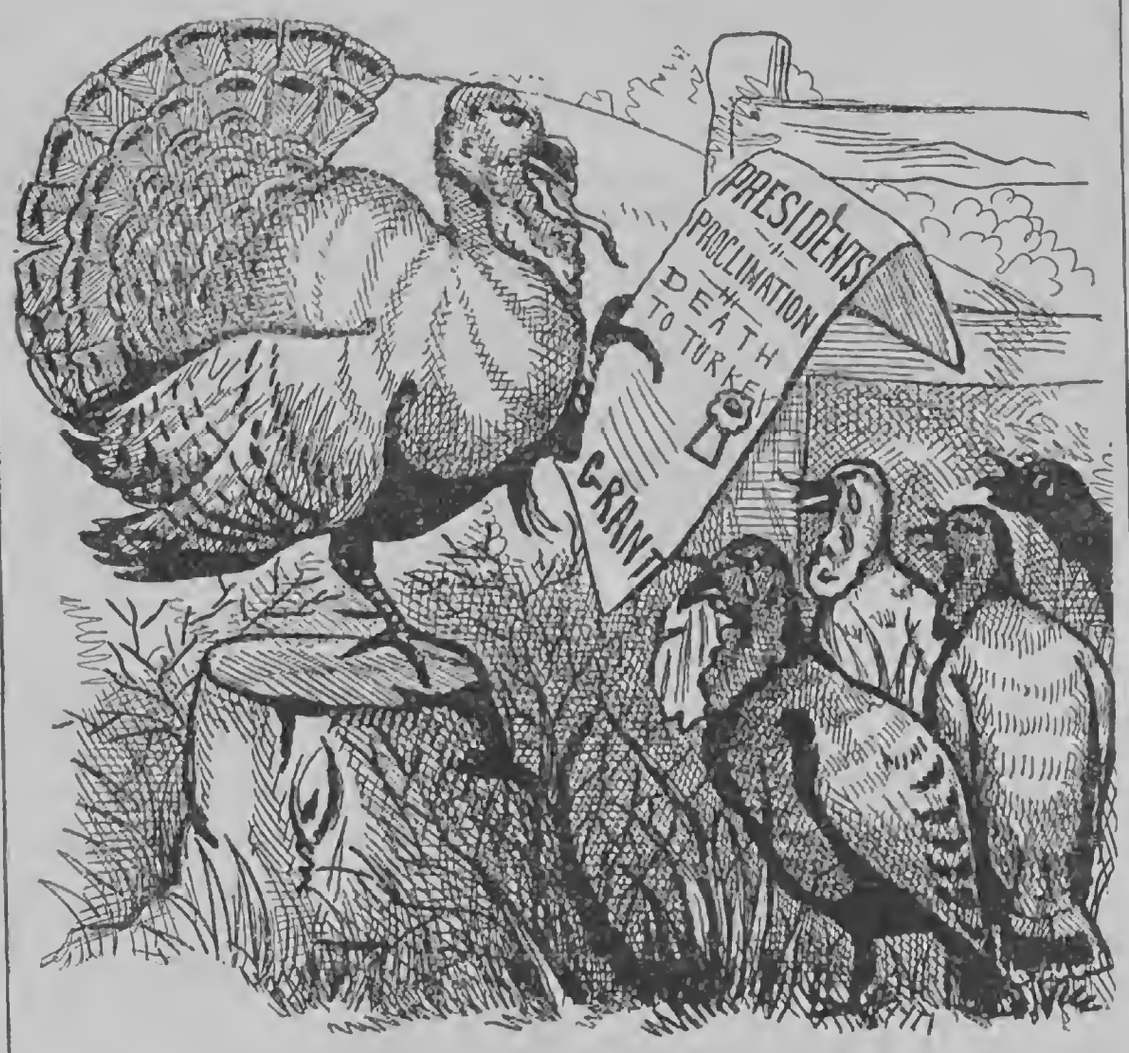
The North Carolina Journal reports that, in consequence of the scarcity of money, cows have become almost the medium of exchange in that State, a thin cow passing for $8, one in good Winter order for $10, and a fat one for $13.

When a blear-eyed, bald-headed weather prophet is asked whether it is going to be a hard Winter, he shuts one eye, looks at the sun with the other, digs up a clump of grass, examines the roots, and says, "I don't know." He is generally correct.

A cigar contains acetic, formic, butyric, valeric, and propriouic acidin, prussic acid, creosote, carbolic acid, ammonia, sulphureted hydrogen, pyridine, viridine, picoline, and rubidene, to say nothing about cabbagine and burdockic acid. That's why you can't get a good one for less than five cents.

The Chinese do not seem to have an intuitive idea of the sanctity of an oath. A consular office-boy, who had been in the service nine years, was looking for something which he evidently could not find, and was asked what it was. "The consul is going to try a case this morning," he replied, "and I am looking for the little book he makes the witnesses smell."

How they Timed Him.—A Massachusetts young man went to visit his true-love the other evening, and his friends at the house where he boarded resolved to ascertain what "time o' night" he got home. So they put a tin pan on each of the stairs in the hallway and tied them all together by a string leading from top to bottom, and fixed them so that when he softly opened the front door and sneaked in the pans would descend and meet him. And a little while before daylight those in that house who were not in the trick covered up their heads and softly prayed under the mistaken impression that an earthquake had arrived and it was time to get ready. But it wasn't. 'Twas nothing but "them pans" heralding the young man's approach.



TWO SIDES TO THE SAME QUESTION:—THE OTHER SIDE.

PRESSED FERN,

Including the native creeping variety (*Lygodium palmatum*). Also a fine stock of Pressed Fronds, of the rare and beautiful Brazilian and New Zealand varieties. Per doz. fronds, post-paid, 20 cts; 6 doz., post-paid, $3. Address DEXTER SNOW, Chicopee, Mass.

RURAL RATES REDUCED!

In announcing the reduction of the subscription price for The Rural New-Yorker, we can only say that it is done in a spirit of justice to all our subscribers, who are now paying reduced prices for everything. The old price for The Rural has been $2.65 per annum, and the

Present Reduced Rate is $2.50 per Annum,

and in clubs of ten or more, $2.

Great encouragement has been given us in our efforts to make the

BEST ILLUSTRATED

Agricultural and Family Weekly

ever published, and we make, in this Centenary Year, this substantial acknowledgment of it. It now costs us less to make the paper, and we propose to give our subscribers the benefit of every cent of the reduced cost.

ALL WE ASK

is that each subscriber and agent will continue his efforts to increase our list so that we can make a still further reduction.

The cheapest paper is not always the best, but

The Best Paper is Always the Cheapest!

Subscribers, show The Rural to your neighbors and ask them to subscribe. They will be benefited and you will be profited.

ALL AGENTS ATTENTION!!!

Increase your lists at the reduced rates and get larger Premiums.

Floricultural.

ABOUT HOUSE PLANTS.

As the flowers in the garden fade we begin to appreciate more highly the tender exotics cultivated in the house. Persons having greenhouses and conservatories are among the favored few who have the facilities for keeping a greater number of plants than those who have not. Still it is doubtful if they obtain more pleasure therefrom than those who keep but a few cheap plants in the windows of their dwellings.

Almost every woman loves flowers (as also do a great many men), and while there are thousands who do succeed in keeping a few plants in pots through winter, many are deprived of the pleasure, owing to the severity of the climate and badly-constructed houses. Still, we have among our readers a great number of persons who would almost as soon think of going without tables or chairs as they would without a few handsome-foliaged or winter-blooming plants. In these persons we are always sure of an attentive audience when talking of flowers, at any and all seasons, and perhaps we take as much pleasure as they do in our chats about the treasures of Flora's kingdom.

While working among our own house plants this morning, we were reminded that there are some kinds better suited to window culture than others, and while everybody is well aware of this fact, some may be at a loss to make a good selection out of the great number in cultivation. Of course, as we look upon the pure white *Camellia* flowers expanding before us, we are inclined to start a very select list with this Queen of winter-blooming, evergreen shrubs; but the thought comes that they are expensive and require considerable care in order to secure a good show of blooms. Hence those who do not possess a good conservatory in which to keep Camellias had better not invest in them to any great extent.

Fig. 1—BOUVARDIA DAVISONII.

But there are plenty of other plants with which to start or fill up a good list for window culture. Among the very best blooming at this season and continuing nearly or quite all winter, the *Bouvardias* are scarcely to be excelled. There are many varieties in cultivation, some brilliant scarlet, others crimson, with every gradation of color to pure white. The flowers are small, but produced in large clusters at the end of each branch or twig, as shown in Fig. 1, which represents a cluster of the flowers of *B. Davisonii*—a pure white sort, introduced a few years ago, and still one of the very best of the light-colored varieties. There are about a dozen distinct varieties cultivated by our florists, and all are first-rate. The Bouvardias are of easy culture, succeeding well as window plants, and may be planted out in the garden during summer and potted again in the autumn.

ABUTILONS.

The *Abutilons*, or Flowering Maples, must not be omitted from the list of choice window plants, and especially the elegant *Boule de Neige*, which we are now offering to subscribers (see Publisher's column).

GERANIUMS.

The Geranium is never to be omitted, and it is doubtful if it ever is from even the smallest collection of house plants. The single-flowered generally bloom a little more freely than the double sorts, but the flowers of the latter do not fade and fall off quite so soon as the former. Hence any slight loss in numbers is made up in stability of character. A good truss of a double Geranium, similar to the one shown in Fig. 2, is like a bouquet of miniature, full-blown roses, but far more lasting, although lacking something in fragrance. Such varieties as Marie Lemoine, Triomphe, Charles Lyell, Le Negre, Asa Gray, and the Hero of Strasburg, when well-grown, leave very little to be desired in the way of Geraniums. Of course a few of the Ivy-leaved and some of the scented kinds may be grown for their pretty foliage and fragrance, but otherwise they do not equal the best double varieties.

Fig. 2—DOUBLE GERANIUM, MARIE LEMOINE.

COLEUS.

The *Coleus* is among the most popular of all the foliage plants for bedding out in summer, but unfortunately they are not easily kept over winter, except in a greenhouse. The heat and dry atmosphere of an ordinary room do not seem to be congenial to the different varieties of the Coleus, still many persons do manage to winter them safely among their other window plants. Instead of trying to winter the old plants growing in the border, it is much better to strike a few cuttings early in the fall, say the last of August or first of September, and when these are well rooted, put them in small pots and take them indoors in time to save them from frosts. These small plants are not only very pretty, but a large number can be kept in the same space required for one large one taken from the garden, which, by the way, are very likely to lose all their lower leaves from the effect of a change of temperature, even if the potting is done carefully. One of these small Coleus plants, soon after becoming well rooted, is shown in Fig. 3 (page 377), the variety being one of the golden-leaved, known as Her Majesty.

Where plants are kept in a window, the Coleus may be set upon a shelf near the top, as they require a pretty high temperature in order to keep them growing and preserve the bright color of their leaves during the winter.

WATERING.

Many make a mistake in watering plants too frequently and a little at a time, just keeping the surface of the soil moist, while the bottom remains dry. The better way is to give the soil a good, thorough soaking, and then give no more water until the soil shows considerable dryness and some of the larger leaves exhibit signs of wilting. Of course there are plants—for instance, the common Calla Lily—which thrive best in soil that is constantly soaked with water; but there are comparatively few window plants that require such an amount of moisture to keep them growing or healthy.

INSECTS.

An occasional sprinkling with water into which is put a small quantity of ammonia or alcohol will remove the various kinds of lice or scale insects which infest house plants. We have found nothing to equal alcohol in removing the Mealy bug, which is frequently very destructive to most kinds of tender plants.

MISCELLANEA.

THE "LITTLE ANNOUNCEMENT"—REQUIESCAT.—We have received more orders under the above heading than we had anticipated. The consequence has been, we were unable to send to any as many seeds as we would like to have done. But every order was filled up to the time of the limit, Nov. 10

Since that date we have received others which we must return, for the excellent reason that our supply is exhausted.

This matter of forwarding seeds to all subscriber-applicants has been a deal of trouble and has consumed a deal of time. But we are glad to say that the friendly, encouraging, appreciative letters that have, as a general thing, accompanied them, have well rewarded us for both, in consequence of which we hope to be able to make the same offer to our floricultural friends, another year, with an additionally attractive list to select from.

IMPOTENCY OF POLLEN IN YOUNG PLANTS.—It is generally the case that young fruit trees blossom several years before they bear fruit. Either the pistil or stamens, or both, are, therefore, immature. It is not improbable that the pistils mature a year or so before the pollen becomes potent.

Two years ago, a young Cherry tree bore its first blossoms, though no fruit formed. Last year it blossomed again. We applied pollen from another Cherry tree to the stigmas of two flowers and marked them. They alone of all the blossoms upon the tree formed and ripened fruit.

If this fruit were due to the artificial application of potent pollen, such crossing may prove serviceable when we wish to ascertain whether a young tree is true to name, and also when we wish to hasten the formation of fruit, so as to ascertain its merit, upon seedling cions grafted upon other stocks.

"AS THE EARLY TULIPS are now so much used for the decoration of the flower-beds in spring, it may be remarked that the later-flowering varieties can be had in bloom at the same time as the earlier sorts by planting the latter deep in the soil, say to the depth of five inches, instead of the ordinary depth of three inches. We have known this method to be attended with considerable success, but some knowledge of the varieties is necessary on the part of the planter. Experience is an excellent and reliable teacher in this case."

The above suggestion of the Gardeners' Chronicle is well enough as an experiment. But as a main object in planting early, intermediate and late Tulips is to have a succession of bloom and to prolong the Tulip season as far as possible, there can be little inducement to gain the knowledge and experience necessary to determine which of the late Tulips are best adapted for the purpose.

CATALOGUES.

MR. JAMES VICK'S "Floral Guide" for 1877 is received. He says that he has endeavored to make it "beautiful, interesting and instructive," and in all candor it is our opinion that he has succeeded. We make several extracts:

Many, well versed in horticultural literature, no doubt think that we might take higher ground, teach the mysteries of vegetable physiology, and speak of those rare plants that are the wonder and admiration of the world, but which few will ever see, and not one in a million can ever own. We prefer to write for the people and of the people's flowers, and we see as much to admire in a Pansy Plant or a Ten Weeks' Stock as in the Giant Trees of California, the Palms of the Tropics, or the Tree Ferns of the Pacific Islands. Our desire is to create a taste for the beautiful in gardening and a true love of flowers among the people.

Speaking of new double flowers, he says: "We have many flowers giving occasionally a plant with double flowers that we shall keep on probation until they do better, and foremost among these is a *Phlox Drummondi*, of which we have lively anticipations. That this characteristic may become permanent before long we greatly desire."

That Mr. VICK *is* modest, and that the present number of the Floral Guide is not without a dash of spice here and there, let the following extract speak for itself:

SOMETHING VERY BEAUTIFUL.—Now, a good lady in Cambria, Mich., in some way obtained our photograph, and not believing that "beauty unadorned is adorned the most," with great taste and patience surrounded it with a wreath of colored flowers cut from our colored plates in the style that ladies call *Medley Pictures*, and it now adorns our office, and we can say, we hope with proper modesty, is really a "thing of beauty," —so everybody says—but whether they mean the portrait or the surroundings, or both, we cannot say.

FAILURE AND SUCCESS.

As you have requested your readers to give their experience whether success or failure—here is mine—failure first:—I started out in the spring with high hopes of success, purchased *Salpiglossis*, mixed colors. *Eutocas*, also mixed, and a collection of German and French Asters; all were sowed in a seed-bed and came up finely. When of suitable size, I transplanted them to beds prepared for their reception which in an hour or so were favored with a delightful shower. Of the *Eutocas*, some were transplanted to a shady, the rest to a sunny situation. They *all died*. I cannot ascertain from searching catalogues that *Eutocas* will not bear transplanting. Can you tell me how to cultivate them successfully as I think their little star-like flowers are so pretty.

The *Salpiglossis*, transplanted to a sunny situation lived and grew well enough, but there were few blossoms and their tall, ragged stems looked ungainly to say the least. So here was disappointment if not failure. But the Asters, oh! what beauties they were. I can yet see one bed in particular, though the frosts have long since destroyed them. In the center were planted the tallest varieties nicely tied to small stakes; then the smaller varieties, and on the outer edge the little dwarfs closely set, (what beauties the dwarfs are!) all bordered with a row of smooth, whitewashed stones which were encircled by a gravel walk. The stones raised the bed somewhat higher than the walk forming an oval surface which, planted as described and filled with the flowers of all shades of Asters yet produced, was the admiration of all who saw it. This was my success and I feel abundantly rewarded for all my labor.

They tell me that Aster seeds of my own raising, will produce inferior flowers during following seasons upon our own grounds. This seems to have been the result with others of this neighborhood. I would like to hear from you upon this subject. BROWNIE.

[*Eutoca* (*Phacelia*) is easily cultivated. Give it a warm situation and cover with pots for a few days after transplanting. You should select the seeds *only* from the finest flowers of Asters and change the soil every season. ED.]

Farm Economy.

AGRICULTURAL CHEMISTRY.

WHAT has agricultural chemistry done during the last 50 years to benefit the farmers of the United States? For 40 years I have searched the agricultural publications in vain to find something emanating from the researches of Professors of scientific agriculture that every farmer can profitably apply to his farm management, and thus enable him to lessen his expenses, and increase his profits. Prof. ATWATER, in the Agriculturist, says:

I sometimes wonder what some of my good conservative farmer friends, who are satisfied with the old ways of tilling, breeding, and feeding that our great grandfathers tried and proved, and take no stock in new-fangled notions and scientific theories, would think if they were to see how the experiments are made in the German and other European Stations, the labor, patience, and money they cost, and the ways their results are applied. The accounts of the experimental investigations on the subject of Animal Nutrition that have been published during the last fifteen years in the German language alone, would make what most people would call a good-sized library. The experiments thus described are numbered by hundreds and even thousands, each one of which has cost the labor of days, weeks, and even months. They have called in requisition the services of the ablest scientific men and the most successful farmers. They have involved an incalculable amount of thought, care, and toil, in the laboratory, the stable, and the study.

Well, what has this "good-sized library" done for the general benefit of the tillers of the soil? Can we to-day lay our hands on a single volume in the English language from *any* source, treating on such experiments as are alluded to in the above extract, that is worth the blank paper it is printed on, in a *practical* point of view? In Germany there are many wealthy gentlemen, who spend vast sums of money in experiments for their amusements, and to pass away pleasantly their leisure hours; but I cannot see that they have done much for the benefit of the agricultural world. Prof. ATWATER, seeing the inutility himself of publishing this "good-sized library," says:

"Many will say: 'Well, what real practical good do plain farmers get from all this scientific experimenting and book-writing!'" Then he goes on to say:

"These investigations have done a vast deal to settle the questions about stock-feeding, that occupy so much space in the papers, and are perplexing as they are important to millions of farmers on both sides of the Atlantic. Combined with the results of daily farm experience, they have shown for what purposes different kinds of fodder materials are best fitted, and how much each is worth: they have taught the farmers how to make valuable fodder out of poor hay and straw."

But how is it that the farmers of the United States have not been supplied with the translated book that tells how to do these things? Why, the Professor could make a fortune in a single year by publishing such a work! Then how cruel it is, in such hard times as we now have, to withhold it from our poor farmers, who are scarcely able to keep soul and body together.

The Professor, however, gives a reason why this book is not published, having been many times asked: "Why not translate into English that German Farmer's Diary?" He replies: "That is a remarkable little book, and a number of others that, like it, are brimming full of just the plain, concise, practical information that every farmer most urgently needs, and nothing but the most costly research, combined with the longest and best experience can supply. But these books are prepared, not for American, but for European farmers."

Is not that too bad! "Prepared for European farmers! Well, I suppose that we must continue to grope on in darkness, without ever being able "to make valuable fodder out of poor hay and straw." But we will pay off those selfish, "European farmers" some day, when we publish "remarkable books, brimming full" of something that they'll want to know.

But the Professor, at least, gives us a clue to the real cause, why these books are not translated into English; he says: "They would not be quite adapted for use here." That is the reason, no doubt—not of any value to us.

Now, if we turn to American scientific experimenters in agricultural matters, and to writers on such subjects, including what has been done by our Agricultural Colleges, what do we find has been accomplished during the last half century to advance the interests of farmers? Has there been a single publication issued by any of them, or essays published by these experimenters and writers, in the agricultural press, that have been of any especial value to our farmers practically? If there have been any developments from these sources, beyond a few experiments in growing crops with special fertilizers, that have proved nothing of general value, and some other unimportant investigations, I have failed to hear of them. We see a good deal written on applying commercial fertilizers to crops; but the man is yet to appear, who shall give us a formula for the application of these fertilizers, including the general list, that any two farmers may follow with a certainty of a profitable result. Farmers feed their live stock, as they did 50 years ago—cows on hay, cornstalks, roots and meal; hogs on corn, meal, cooked or uncooked, boiled mashes of potatoes, or roots with meal—just as they did when we old men were boys; and the time, I fear, is away off in the impenetrable future of centuries after centuries, when farmers shall learn "how to make valuable fodder out of poor hay and straw." No, farmers, that day will never come. We may make poor hay and straw eatable, by steaming and adding meal to give a flavor; but we can add nothing to the value of such fodder. Suppose we get a mangerful of "poor straw" into the stomach of a cow, of what value would it be? It would produce no milk, put on no fat, satisfy no appetite and produce no manure of much value.

I am not inclined to be "hard" on our scientific experimenters and writers; but the fact does exist, I claim, that it is not possible, through agricultural chemistry, or otherwise, to change the general management of farms, except in the use of improved farm implements; and there is where science is acknowledged as having done what, in some things, was never thought to be possible to effect, till they came into existence.

Linden, N. J. T. B. MINER.

FARMER'S NEED.

THAT there is a need of more and better education among farmers none can more fully deplore than the farmer himself. But is it a fact that there is greater need of more education among farmers than among other classes of working people, proportionally, or even among the professions? Will they not compare favorably, as well informed and good citizens, with any other class? That they are otherwise, and that any such insinuation or reflection, should be cast at their door, as a class, the writer as one of them would most indignantly resent. Taken as a whole what other class are better informed, generally, or better understand practically, their business? Perhaps they may be less learned in laboratory science than some exceptional cases among scientists; but when we come to the real practical, there is very much less wanting. Put the theorist in the same place as the practical farmer, with only the same pecuniary means, and the same demands upon him, with only his resources to fall back on, and which of the two will add the most to the dollars-and-cents wealth of the neighborhood and country, in a given time, say five or ten years? And what other trade, profession or pursuit is so generally successful, in self-support, as the farmer's?

Comparatively there are very few American farmers that are not compelled to be the architects of their own fortunes; and very few attain such wealth as to raise a large family and classically educate them, and further endow them with sufficient means to send them off at the same speed the elder ends with.

The American system is more of a democracy than an aristocracy of wealth: the accumulated wealth of the parent being equally divided among all his children instead of entailment to the eldest son; so that practically, in a large family, the youngest is better started than those older.

Farming under such circumstances becomes a matter of "bread and butter," or rather how to obtain it, in a majority of instances; little time can be spent in obtaining anything more than the rudiments of an education, sufficient for every day life and use in practice, the practice perfects theory or knowledge primarily obtained from books or otherwhere. As a general rule practical farmers understand what is necessary in order to retain or increase the fertility of their soil; the fault does not lie in that direction generally, but rather in their necessities and limited resources.

Men and women brought up and educated with everything ready made at hand, little comprehend what trials, &c., the great majority are obliged to undergo in order to live respectably within their means.

Let us recall what many now on the stage have experienced, or know from observation &c., in attaining to their present positions, and we must recollect that the advantages of obtaining education and property to-day are far superior to those enjoyed by our fathers and those before them in this country, and also that we are constantly improving thereon—it may be not as fully as we might, but improving still.

The average farmer, as we remember him, raised a large family of sons and daughters, with more or less sickness, generally more, in the family; his means were all invested in a farm and home for self and family; whatever income he might have was derived from the products and sales from the farm, with perhaps, a little from days' work out, at from forty-two cents, to four shillings per day, more frequently at the less price than any greater; if he grew corn or other grain he obtained the equivalent of a day's work for one bushel of rye, somewhat less for corn, and for oats somewhere from twenty to twenty-five cents; for potatoes he was fortunate if he sold them as high as twelve and a half cents per bushel; good English hay, $6 to $8 ₱ ton; a good new milch cow $12 to $15; a pair of four year old steers, broken, $30 to $40; other stock and produce in like proportion; wood cut and drawn to market $1.50 to $2 ₱ cord. A sheep or lamb was well sold if either brought one dollar; wool ten to twelve cents ₱ lb.; and very frequently all these prices were for barter trade; all other salable products in like proportions, while groceries, dry goods, &c., were at our recent war high prices.

Economy was the order of the day, and if in its closest and strictest sense they were able to live very few extras could be had. Flax was grown, dressed and made into bed linen, and for wear, &c., by hand, in the family; wool was also worked up similarly for all purposes where woolen goods were needed, for wear and other domestic purposes, sometimes for sale. All things else were made in the family, so far as possible, wherein a saving of paying out money might be accomplished. With such necessary pinching to get along what wonder that education was neglected, and the young obliged, instead, to lend a helping hand to keep the wheels moving.

Kind Reader, this is no fancy sketch, but is what many of our parents and grand parents, in rural districts, now living can substantiate, only that the half is not told. We ought to be thankful that they were able to provide for us so goodly an inheritance; and the rising generation that they are provided with so many privileges, which we think they are making good use of, so far as is compatible with strict economy.

Reading for gaining extended information and improvement is pursued to a considerable extent in farmers' families, and from that reading much is deduced and put in every day practice, still there is room for improvement; but it is well to bear in mind that there are many difficulties and obstacles for the farm population to overcome which the professions, &c. know, or think not of. Instead, therefore, of chiding the farmer for not devoting more time, money and attention to the obtaining of education, &c., we should encourage him in all his efforts, and consider that there may be extenuating circumstances which may exonerate him from any apparent neglect.

Westborough, Mass. W. H. WHITE.

INDIA RUBBER BANDS FOR TREES.—A New Haven company is making a new thing to protect trees from worms. The invention is a rubber band with a single bristling row of brass pins set very close to each other, like the teeth of a comb, in the middle of the strip, and worms cannot crawl above it. While this device might answer for crawling worms, it would be of no use as a protection against flying insects.

Dairy Husbandry.

FAULTY CHESEE—HOW AVOIDED

A CORRESPONDENT who has a dairy of 27 cows and who is making cheese on the farm writes us that he is having some trouble this fall in getting his cheese down firm and solid. "It is disposed to be loose and spougy, and what is the remedy?" etc.

If a detailed account of the method pursued in manufacture were given, we should be better able to point out faults and make suggestions for their correction; but in the absence of anything more definite than the above, we should say that "the milk is made up too sweet." During fall and spring, when the weather is cool, milk is slow to take on an acid condition, and where the manufacture of cheese is carried on from day to day the curds will require to lie a longer time in the vat than during summer. Not unfrequently the required acidity is not obtained for several hours under the usual manipulation, and if the curds be removed to the hoop before the acid is sufficiently developed, the cheese will be loose and spongy and the whey will not readily separate and pass off in pressing. These spongy curds are of frequent occurrence during the change from hay to grass, or from grass to hay, and the cheese, of course, does not sell well in market. The remedy is to hasten acidity by the use of sour whey. It may be added to the milk at the time of putting in the rennet, or later, while the curds are scalding. Old cheese-makers, who can judge very correctly as to the condition of the milk when ready to start heat in the morning, prefer to add sour whey at the same time with the rennet; but in case the cheese-maker is rather inexperienced, perhaps it may be as well to use the sour whey while the curds are scalding. No particular rule can be given as to the quantity to be used, as this depends upon the condition of the milk. If the milk is quite sweet, from one to two gallons is not unfrequently used for thirty gallons of milk. If used in the whey while the curds are scalding, it can be added in small quantities, from time to time, until the required acidity is produced. This condition of the curds is best known by applying the hot-iron test. Take a handful of curd from the vat, press out the whey and bring it in contact with a piece of iron heated so that it will "sizz." Then, on withdrawing the curd from the iron, if small threads are formed, or in other words, if the curd "spins" out into threads, the acid is properly developed. The threads should spin out from one-half to three-quarters of an inch in length.

The sour whey to be employed should have been previously prepared as follows:—Take any quantity of sweet whey and raise it to near the boiling heat. The oil and albuminous matter will then rise to the top and may be skimmed off. The whey thus freed from impurities is set aside in a cask or other convenient vessel until it becomes distinctly acid, when it is ready to be used.

In factories there is generally not so much necessity for using sour whey in cheese-making as there is at farm dairies, because the milk, coming from different herds and carted to the factory in cans, which are not always perfectly sweet, will have a tendency to start well on toward acidity. When the acidity is once begun, the subsequent heating and manipulation of the milk and curds hasten its development, and hence in many factories sour whey is not employed. In small factories, however, when the milk is kept very sweet, it is used with advantage.

Acidity in cheese-making is one of the leading features of the cheddar process. It assists the curds to readily part with the whey; it imparts a solid texture to the cheese, prevents porosity, and helps the cheese to develop that sweet, nutty flavor so much sought after by our English customers. A soft, spongy cheese does not readily part with its moisture. The surplus whey which remains in the cheese soon decomposes during the curing process which the cheese undergoes, and gives the cheese a bad flavor. So well is this understood abroad that a porous, spongy cheese is avoided, even though it may be of good flavor at the time, because it is known that such a cheese cannot retain a sweet flavor long, but must soon turn bad and rot down.

The art of making good cheese depends largely upon management in the development of acidity. If not carried far enough, the cheese will be porous and fall into decay; if carried too far, it will be hard and crumbly; but when tempered to the golden mean, we have perfection of flavor and long-keeping qualities. The process can only be learned by experience.

Enough perhaps has been said to guide our correspondent in his operations, so as to correct the fault complained of in his cheese, and we trust our suggestions may help others who may be laboring under difficulties similar to those named.

IMPROVED BUTTER HOUSES IN THE NORTHWEST.

DEAR SIR:—When I resigned my position as Superintendent of the Agricultural Department of the International Exposition, I came directly to Byron, Ogle Co., Ill., to design and erect a butter factory for ISRAEL. BOIES, Esq., late of Marengo, Ill. My instructions were to construct the most perfect dairy house of which I was capable and to embrace in the plan my patent system of subterranean ventilating and cabling, and to give the building capacity for handling the milk of about 800 cows. The building is now about completed, and it is acknowledged by the most intelligent and experienced dairymen who have inspected it to be the most perfect butter factory in the country.

The sub-earth ventilating and cooling duct has been in operation some six weeks, and its efficiency has been witnessed by dairymen from far and near. All express surprise and delight, and a dairy firm at Marengo, Ill., handling the milk of 600 cows, has ordered plans for the alteration of their butter factory on my system. Dairymen here have recently organized clubs, and several new and very large factories are to be built on my plan in the spring.

As many of your readers are aware, I have hitherto laid my ventilating ducts but five to six feet below the surface of the ground, and with that depth I secured 60 to 62°. The duct at Rose Hill Dairy, which I erected for Mr. BOIES, is 9 feet 6 inches in depth and 150 feet in length. The temperature of the air flowing automatically into the dairy has been uniformly, at all times since it has been in operation for the past six weeks, 48° by one thermometer and 49° by another. There has been no hot weather during that period, but the external temperature has varied from 50 to 74°. I erected a spacious ice-house adjoining the dairy, but Mr. BOIES has decided not to fill it with ice, but to use it as a commercial butter storehouse, as the temperature attained by the duct without ice is lower than he desires. A branch of the sub-earth duct discharges into the building originally designed for storing ice, giving it the temperature above stated.

The duct has a fall of about 10 to 100 feet linear, and there is a very perceptible current in the duct and through the dairy when the external temperature is only 3° or 4° higher than that of the air from the duct.

The convenience of the detail of the factory is such that his butter-maker says that he can handle the milk from 800 cows, run the engine for churning, and make and pack the butter without an assistant. Those who have experience in butter-making and have examined Rose Hill Dairy express no doubt but that he will be able to do so.

I should add that he purposes to milk 15 cows night and morning, in addition to the care of the factory, and I should not omit to add that the said butter-maker is a partner in the factory. Mr. BOIES is the peerless butter-maker of the Northwest who was awarded the $300 prize for the best butter by the St. Louis Agricultural and Mechanical Association in 1874. As my system is well understood by all who have read "Willard's Butter-Book," I shall not attempt to describe it in detail. Suffice it to say that it is *cheap* and the *best* in use. J. WILKINSON.

Baltimore, Md.

We give place to the above letter because any suggestions for the improvement of Butter-dairy buildings will be of interest to dairymen. We may remark in this connection that the "Centennial Dairy Ring" of the American Dairymen's Association tested Prof. WILKINSON'S Sub-earth Duct at the "Model Cheese and Butter Factory" on the Centennial grounds and pronounced the thing a failure.

The Ring, as is well known, had a "model factory" erected which proved *worthless* for keeping Butter and Cheese during hot weather. Finding that the building was improperly constructed, a short Sub-earth Duct on WILKINSON'S plan was put in: but as the building was not altered to meet the requirements of this system of cooling and ventilation, it of course failed. WILKINSON writes us that he was sick at the time the "Ring" put in the duct, and when he got out and saw what was done, he at once told the Committee that it would not cool and ventilate "that open, illy-adapted building, imperfectly as it was constructed."

Mr. ISRAEL. BOIES is a gentleman well known to the dairymen of the East, as well as of the West, and the fact that so distinguished a Butter dairyman should adopt the Wilkinson system must go to show that it has merits. We shall be glad to hear from Mr. BOIES on the working of his Butter dairy, because a practical test under Mr. BOIES' superintendence will be substantial proof of its utility or otherwise.

CENTENNIAL DAIRY SHOW.

IT is sometimes well to "see ourselves as others see us," and many of our contemporaries, who asserted at the opening of the Centennial show and long afterwards, that the RURAL NEW YORKER, was wrong in declaring that a "Dairy Ring" existed, which if left to control the exhibit of Dairy products would render the labors of honest men utterly useless, have at last come to the conclusion that we were not far wrong in our assertion. But the existence of a "Dairy Ring," at the Centennial, it seems has also been discovered by visitors to the show from abroad, as the following extracts from the letters of a correspondent of the English Agricultural Gazette, plainly indicate. After some preliminary remarks the writer says:

But my object in this communication is to publish some facts collected at Philadelphia, and while travelling through the dairy section of New York State. During my visit to the Centennial Exhibition in July I inquired for, and with some difficulty discovered, the locality of the dairy building. On approaching it, I was favorably impressed by its imposing appearance; and looking at the verandahs which sheltered the windows from the sun's rays on that intensely hot July day, I came to the conclusion that the interior would be magnificently cool—the best place in the world for an exhibition of cheese and butter. I also expected to find the factory a building which should possess all the excellent arrangements of the best of its class without any of their faults, and which should prove to the admiring visitor that there were members of the American Dairymen's Association who knew as well how, when occasion required, to build factories as to manage them. But an examination of the interior dispelled all these pleasant illusions. Far from being the model I had pictured to myself, I found the exhibition rooms utterly unfit for the storage of cheese; and in lieu of well-arranged making-rooms, there were four apartments opening on a corridor, like bedrooms in a hotel, in which were carrying cans, self-heater vats (these, as a class, have been almost entirely discarded for several years past by the best makers as inferior to those fitted for, and supplied with steam from a boiler), milk pans, &c.

I was up to that time under the impression that during the Exhibition cheese would be manufactured in this building. How this could be done in such rooms as were here provided for the purpose I could not then imagine, and at once became satisfied that my impression was a false one. I was surprised afterwards to learn that the conclusion I had naturally arrived at when I visited the factory was not correct, but that the Centennial Commissioners were really intending to exhibit their system of manufacture by buying and making up milk during the autumn months. I am not aware that this intention has been carried into effect. Perhaps its impracticability disclosed itself on a closer examination of the circumstances, inducing the Commission to abandon it.

In the cheese-rooms I found the temperature very high, reported as sometimes over 100° Fah., which statement I have, from my own observation, every reason to believe correct; and this, in spite of the fact that air ducts, after a modification of the plans of Professor Wilkinson, of Baltimore, had been constructed for the purpose of cooling the interior of the building.

I am satisfied that, had the original plans been carried out, the effect would have been all that could be desired; but the attempt to improve on the arrangement recommended by the inventor was a complete failure. The cheese suffered, of course, from the extreme heat, and it was literally impossible for any person unacquainted with that article, under any other circumstances than those of purchase and consumption, to come to any just conclusion concerning the ability of American dairymen, or the value of their goods as compared with those of other countries.

I found that the Canadian exhibit was much larger, and withstood the heat better, than that of the United States. This I could not understand, as I was well aware that factories were far more numerous in the latter country than in Canada, and the average quality of the cheese of the Republic was fully equal to that of the neighboring Dominion. I felt inclined at first to jump hastily to the conclusion that Canada had so improved her system of manufacture as to leave the older dairy country behind in the production of goods possessing the ability to withstand a very high temperature. Failing, however, to clear up this mystery to my satisfaction during my stay in Philadelphia, I subsequently, learned the whole history of the "Dairy Ring" and its operations, which eventually proved to be the cause of the state of affairs which had seemed to me so unaccountable.

In answer to queries, it was explained that certain members of the American Dairymen's Association—including Professor L. B. Arnold, Messrs. O. S. Bliss, J. H. Reall, of Philadelphia; and W. Blanding, the architect of the dairy building at the Exhibition—had formed themselves into "a ring," which, as I suppose you are well aware, is a peculiarly American institution. In all their transactions the wishes and opinions of other leading dairymen—who, as men of experience, should have, in the interests of justice, been consulted—were totally disregarded. Professor Arnold and other friends of the ring were appointed jurors, and for a moment it seemed as if selfishness would gain its end, and the "cute" Commissioners win for themselves by underhand dealing the credit they did not deserve. (Let us add that our correspondent's assertions here are given on his own responsibility. We shall be glad to publish whatever explanations or criticisms they may admit of.—ED. *A. G.*)

But the course of a ring, as of true love, never did run smooth. Mr. Reall, on discovering the awkward position in which he was placed, withdrew, and publicly exposed and denounced the policy of the clique, while Mr. Bliss by his integrity also drew on himself the resentment of the leaders. Much indignation was expressed by the American dairymen who were not of, or attached to the ring, and with those who so fortunately withdrew from it they joined in denouncing the transactions of the men who had combined for purposes of pecuniary gain and self-aggrandisement.

Had this explanation been offered by only a few of those who naturally felt annoyed at the injustice done them by the formation of the ring and its policy, I might have fairly suspected that, smarting under their wrongs, they had magnified the cause of their annoyances; but after having visited many of the leading dairymen, and on inquiry received the same statements, I came to the conclusion that they were true, and the "Centennial Dairy Ring" a veritable reality. I was also repeatedly assured that the best makers had not exhibited, and but a few of the second class.

In conclusion, I wish to impress on the minds of your readers the following facts: First, the factory at Philadelphia was not as a building fit for either the manufacture or exhibition of cheese, nor was it such as would have been erected had the ring never operated, and the leading factory men been allowed a voice in the management. Secondly, although the Canadians won the greater bulk of the earlier awards they derive no great amount of credit from the fact, for had the dairymen of the United States entered earnestly into the competition it was highly probable that they would have come out at least on a level with their neighbors, and many of the prizes now carried off by Canada would have been in that case appropriated by the Republic. In case my conjecture were not correct great honor would doubtless be due to Canada, but under existing circumstances we must fairly give the United States dairymen the benefit of the doubt.

The cheese exhibited by the latter was not a fair sample of their best productions, and I feel justified in saying that when considered in all its aspects, the display was to all intents and purposes a failure.

I think that coming from an Englishman who has no personal interest in the matter beyond a desire to see justice done to all, my opinions and statements will be understood, and the motives which led me to make this communication be appreciated by all who have seen or read anything of the display of dairy produce at the Centennial Exposition.

BITTER CREAM.

A CORRESPONDENT of the Country Gentlemen thus explains the cause of bitter cream:

Cream becomes bitter by long keeping; at three days it will begin to toll; after the fourth day it is unfit to be used in coffee or made into butter, spoiling both.

In Summer there is little bitter milk or cream, because the cream is churned sooner than in Winter, seldom reaching the third day. Sometimes, where there is a single cow kept, I have known the bitter to show on account of the small quantity of cream accumulating. The Summer practice is reversed in the Winter. There being too little milk to require frequent churning then—say one, and sometimes two churnings a week—we account readily for the evils complained of. The forepart of the season, when milk is in greater quantity necessitating more frequent churning, I hear of but little complaint. It matters not how good the feed is,—if the tenderest hay and roots are added, making an approach to Summer feed; nor how clean the milk is kept, the most perfect milk if set beyond three days will be hurt. The writer of this has filled the vessel, leaving barely space enough for a cloth to be stretched over without touching the milk, and a snug lid put on, keeping the air out, but all to no purpose. So, in the purest air, in all the temperatures, it is the same.

It is age that spoils the cream; not only does it make it bitter, but it destroys the flavor, giving it a rank disagreeable taste. The sooner the cream is churned or used after the milk has stood forty-eight hours, the better. If there is too little cream to churn, add the milk and churn that with it to give sufficient body to work it. If the milk has been kept in pure air, and cleanliness observed throughout, with the proper temperature, about 60°, there will not only be an absence of the bitter, rank taste, but a good quality of butter will be produced.

The Poultry Yard.

"COITSTOCK," MR. HENRY BELDON'S RESIDENCE.

I WROTE to you last week of my visit to Mr. BELDON'S pretty country seat, near Bingley, Yorkshire, and my letter left Mr. BELDON and myself enjoying a glass of port, in his dining room, preparatory to visiting his "pets in the mill."

Pray do not think I have been ever since over that glass of port, but I feared at the time that the length of my letter was boring you, and so I had mercy and left a description of the fowl house until another time. Now, if your time and patience permit, I will button-hole you again and give such description as I can of

"THE OLD MILL."

Here are kept Mr. BELDON'S show birds that are so successful at the prize exhibitions, and I was anxious to know how they were housed and cared for.

"Where you exhibit so largely, Mr. BELDON," I said, as we finished that glass of port, "you must be at great expense and trouble in providing 'runs' for your many birds. I presume you must have extensive yards connected with the mill."

"Not at all," he replied. "Many persons suppose that the *modus operandi* of tending my birds is elaborate; but, if you will come with me, we will go through the mill, and you can see for yourself my way of keeping fowls."

We left the house, and stepping out upon the lawn and going through the gate at the end of the "drive," entered the old stone building before us. It is a solid structure of five stories, about sixty feet front, and thirty deep, each story being well lighted by numerous windows on three sides of the building. The entrance is on the extreme right of the building as you approach it. The stairway leading above is on the extreme left. As we entered on the ground floor, we found ourselves in a broad hallway, at the end of which is the "packing room" and "hospital."

"These rooms have not been laid out under my directions," said Mr. BELDON. "You see already that I have no 'fancy' arrangements for the birds; no extensive wired yards; no special buildings of any kind. I have merely taken this old mill and, only placing a few partitions to keep the birds separate, have left things pretty much as I found them."

"An amateur would have thought it necessary to have all the 'latest improvements,'" I said.

"To be sure, Mr. WHITE, and there is where the first grand mistake is made. When the birds are comfortably housed, you have done all that is best for them, and 'latest improvements' are as often the cause of failure as success. Cleanliness, light, air, are what birds need, together with good food, and an occasional run. No 'fancy houses' are required."

"In other words, you mean, if I understand you, that with a plain, good shed and care, birds will thrive as well as though they were reared in a nickel-plated house, and warmed by a fire that burned gilt-edged coal and mahogany kindling-wood."

"Well—yes—that's one way of putting it. I mean that clean housing and proper food are what the birds want, and that your idea that you would see here all the latest improvements will, I fear, be disappointed. Here is where we do the packing of birds that are going away, where we keep the sick or injured ones, and where we keep the eggs for hatching." So saying, he led the way into a large room at the end of the hallway and opposite the entrance, and I saw that he was quite right in saying there were no "fancy arrangements." One end of the room was lathed off to accommodate birds that needed special care, and the partitions were merely such as any farmer might construct for his birds. It was strongly and well put together, but no attempt at anything beyond what was useful.

"Everything is very plain, you see, Mr. WHITE," he said. "No silver plate lying about, as you say, but it answers our purpose well as it is."

"And I notice, Mr. BELDON, that everything is fresh, sweet and clean—no bad odors or foul air in the rooms."

"That I always guard against," he replied. "Everything is kept clean here. When a bird is ill, or has injured himself in fighting, he is put on the retired list here and carefully doctored. To this room we bring the show birds the day before they go to the fair, and here they are washed. Then we turn them into these large boxes, which are filled with clean straw, and in scratching about in the straw, they dry themselves nicely. In this box, at the end of the room we keep the eggs."

He turned back the lid of a long narrow box, which was divided into a number of squares each division bearing the name of the fowl from whose nest the eggs came.

"As we receive orders for eggs we fill them from this box, which gives us the name and age.

Now if you please we will go up stairs. You will see that I have no small chicks here. I have all my birds hatched at various farms, Hamburgs at one place, Brahmas at another, and so on, and when they are old enough to show they are sent in here and I make selection for my own showing or to fill orders."

As we went up stairs we passed a pile of wicker baskets which Mr. BELDON explained were "shipping baskets." They were about four feet long, and two feet wide, by three feet high, made lightly but strongly, lined with muslin, and covered with stout bagging. "In these baskets he said" I send birds all over the world, and seldom if ever have any fault found with their packing, they are light but very serviceable.

On reaching the first floor above the "hospital and packing room," we were among the "show trios" and it was almost a fair in itself. At each side of the room were large "pens" about ten by eight feet, divided by a broad passage-way which ran the length of the room, each pen containing a trio of fowls, or a single cock. They were the pick of Mr. BELDON'S birds and they were indeed beautiful specimens of their kind.

"Whenever I win with my birds I fasten upon the rafters overhead the card placed on the coop by the Judges," said Mr. BELDON. I looked up and received some idea of the extent of his "winnings." I may give you some idea of it when I say that every rafter and beam in the interior of that mill throughout the five stories is almost *covered* with "winning cards!" It was a succession of 1st and 2nd prize cards from all the shows of the kingdom.

"In these pens we keep the birds and they thrive well—are strong, healthy and vigorous. You see they stand upon board floors, which are swept out every morning, and each pen is boarded up at the side about three feet to prevent the cocks from fighting through the lathings. All the hens on each floor are let out in turn; on Monday the first floor takes a run, on Tuesday the second floor, and so on through the week. The cocks are taken out in turn and put under those boxes you see upon the lawn, and are left out for two or three days at a time."

He pointed out the boxes from the window. They were about three by two feet, and had a closely lathed run of about the same size attached to each. The "boxes" looked to be small quarters, but Mr. BELDON said they were quite large enough for the purpose.

"This is the way my birds are housed Mr. WHITE," said my host pleasantly smiling. "Everything is plain and simple. A common lathed pen holds each trio; a rough stick in the corner is their roost; an old basket is their nest; an occasional run in the woods keeps them in health; and cleanliness, regular and judicious feeding, and good ventilation of their quarters are always accorded them. And if you are asked by your friends you may say this is the way HENRY BELDON keeps his birds at "Coitstock." THOS. W. WHITE.

Alden House, Kensington, London, 1876.

BERGEN CO. POULTRY SHOW.

THE Bergen Co., N. J., Poultry Association held their first exhibition at Hackensack, N. J., Nov. 29-30. The exhibition was, on every respect, a great success, the number and quality of birds exhibited being a surprise, even to the most sanguine poultry fancier in the country. The exhibition was also well attended, and the receipts in cash were sufficient to leave a balance in the treasury after paying very liberal prizes.

We congratulate our Jersey neighbors in their great success, and hope they will yet have a chance of meeting birds from other localities, at no distant day, which shall test the merits of the winners of prizes at the late show.

PREMIUMS AWARDED AT THE FIRST ANNUAL EXHIBITION OF THE BERGEN CO. POULTRY ASSOCIATION.

LIGHT BRAHMAS.—Fowls—First and second prizes, John J. Berry, Hackensack, N. J. Chicks—First and second prizes, John Banta, Hackensack, N. J.

DARK BRAHMAS.—Fowls—First prize, Isaac R. Denman, Newark, N. J.; Second prize, John Voorhis, Maywood, N. J. Chicks—First prize, John Voorhis; Second prize, Isaac R. Denman.

PARTRIDGE COCHINS.—Chicks—First prize, W. F. Muchmore, Basking Ridge; Second prize, Ed. Vreeland, Rutherford, N. J.

WHITE COCHINS.—Fowls and chicks—John J. Berry.

SILVER GRAY DORKINGS.—Fowls—First prize, Henry Hales, Ridgewood. Chicks—First and second prizes, Henry Hales.

COLORED DORKINGS.—First prize, Henry Hales.

WHITE DORKINGS.—First prize, Henry Stewart, Hackensack.

PLYMOUTH ROCKS.—Fowls—First and second prizes, John J. Berry. Chicks—First prize, John Salisbury, Jr., Nyack, N. Y.; Second prize, John J. Berry.

SILVER-SPANGLED HAMBURGS.—Chicks—Second prize, D Benedict, Rossville.

SILVER-PENCILED HAMBURGS.—Fowls—First prize, Thos. W. White, Ridgewood, N. J. Chicks—First and second prizes, do.

BLACK HAMBURGS.—Fowls—First prize, Thos. W. White. Chicks—First and second prizes, J. C. & D. Pennington, Paterson.

WHITE LEGHORNS.—Fowls—First prize, John J. Berry; Second prize, John Salisbury, Jr. Chicks—First prize, do.; Second prize, Farr and Cobb, Rutherford, N. J.

BROWN LEGHORNS.—Fowls—First prize, Peter Van Buskirk, New Milford, N. J. Chicks—First prize, Chas. R. Braine, Westwood, N. J.; second prize, A. H. Walton, Jr., Ridgewood, N. J.

HOUDANS.—Fowls and Chicks—First and second prizes, H. A. Grant, Jr., Tarrytown, N. Y.

SILVER POLISH.—Fowls—First prize, Edward Vreeland, Rutherford, N. J.

WHITE POLISH.—Fowls—First and second prizes, Farr & Cobb. Chicks—Second prize, Farr & Cobb.

WHITE-CRESTED BLACK POLISH.—Fowls—First prize, John J. Berry.

BRACE-BREASTED RED GAMES.—Fowls—First prize, Walter V. Clark, Hackensack, N. J.; second prize, Edward Vreeland. Chicks—First and second prizes, Walter V. Clark.

YELLOW DUCK-WING GAMES.—Chicks—First prize, Richard Kirby, 12 Cortlandt St., N. Y.

BANTAMS.—Black-breasted Red Game.—Fowls—First prize, Henry Hales; second prize, A. H. Walton, Jr. Chicks—First prize, John W. Ryerson, Ridgewood, N. J.; second prize, Henry Hales. Silver Duck-wing Game.—Fowls—First prize, J. E. Kipp, Paterson, N. J. Rooted White.—Chicks—First and second prizes, Isaac R. Denman.

TURKEYS.—Male and female—First prize, Peter Van Burkirk; second prize, John E. Kipp.

DUCKS.—Aylesbury—First prize, Henry Hales; second prize, N. R. Bence. Rouen—First prize, G. M. Campbell. Pekin—First prize, H. Hales. Colored Muscovy—First and second prizes, F. Kidder.

PIGEONS.—Four varieties, Pouters, Short-faced Tumblers, Antwerps, and White Fantails—First prize, H. Hales.

SPECIAL PREMIUMS.—No. 1, John Banta, for best pair of Light Brahma chicks; No. 2, John J. Berry, for best pair of White Cochins, plate of fruit; No. 3, Thomas W. White, for best pair of Silver-pencilled Hamburgs, basket of flowers; No. 4, Chas. R. Braine, for best pair Brown Leghorns, one year's subscription Rural New-Yorker; John J. Berry, best pair of White Leghorns, same prize; H. A. Grant, Jr., best pair of Houdans, same prize; J. J. Berry, heaviest pair of Light Brahmas, same prize; Peter Van Buskirk, heaviest pair of turkeys, same prize; No. 5, J. J. Berry, for best collection of fowls and chicks, six bottles of Keeley wine; Nos. 6, 7, 8 and 9, J. J. Berry, best collection of Light Brahmas, P. Cochins, White Cochins and Plymouth Rocks, $5 in each case; No. 10, H. Hales, best collection of Dorkings, $5; No. 11, Peter Van Buskirk, best collection of B. Leghorns, $5; Nos. 12 and 13, J. J. Berry, best pair of W. Leghorns and best pair of W. C. B. Polands, $5 in each case; No. 14, H. A. Grant, best pair of Houdans, $5; No. 15, W. V. Clark, best pair of Games, $5; No. 16, John Banta, best pair of Light Brahmas, $5; No. 17, B. F. Robinson, farmer, best L. Brahma Cockerel, 1 trio L. Brahma Pullets; No. 18, P. Van Buskirk, farmer, best pair of W. Leghorns, two W. Leghorn Cockerels.

PROFIT OF HENS IN LARGE NUMBERS.

WE often read articles, like the one in the RURAL of Nov. 11th, proving that poultry can be profitably kept in large numbers, if the proper course is pursued. Writers very carefully give us the "*Modus operandi*," so that the whole subject looks perfectly clear.

Now while my purpose is not to deny these statements, yet how strange it is that we never meet with any one who is, or has been, successful; at least in this country. A few years ago we were referred to Mr. LELAND, for positive proof that hens in large numbers could be made profitable.

I remember that the "Farmers' Club" in N. Y., sent a committee to interview Mr. LELAND and get at his secret. Their report was quite interesting, as I remember it. In the first part of that report, Mr. LELAND thought his hens cost him about 50 cents each per year for keeping, and farther on, when asked as to the value of the manure made answer that "he considered they turned out manure to the value of one dollar each." On reading this I immediately wrote him wishing to buy hens that could turn out one dollar's worth of manure from fifty cents' worth of feed, but received no answer, so I presume he had none to sell. Some one noticing this statement explained it by supposing that he fed his hens largely from the waste from his hotel, which was of no great value. But this waste was certainly as valuable for manure before being fed to the hens as after; so this explanation was just no explanation at all.

This was worse than to expect our hens to turn out eggs in just proportion to their feed? Who hears of "LELAND" or his hens now?

Occasionally one reads of some person, somewhere, who is having great success but he soon sinks out of sight. Will some one who can prove on paper that a large flock, (or flocks), can be made to pay, prove it by practice?

Syracuse, N. Y. NELSON RITTER.

SAGACITY OF A FOWL.

A GENTLEMAN of Colyton, Devon, tells the following story, as showing the amount of sagacity in the common fowl.

For some time past he has had a tribe of fowls, which, instead of roosting in the house intended for them, have persisted in taking for their abode at night a fine Portugal laurel situated in his grounds. During the last few months a neighbor's hen has been in the habit of joining his fowls, and roosting with them. The neighbor, after various vain attempts to keep the hen on his own premises, at length bethought himself of tying the hen's legs with a short string, in a similar manner to that in which a horse is 'hobbled.' But the bird soon overcame this impediment, and resumed her old haunt.

Shortly after her return in this 'hobbled' condition, the whole household was startled just before dusk one evening by a strange noise outside the house, and on looking to see the cause, they found the cock belonging to the above-mentioned brood of fowls walking up and down in a very excited manner, and giving utterance to a shrill noise, which more resembled a rapid succession of crows than anything else. At length they went out to him, and he fled, still screaming, towards the Portugal laurel, where, on following him, they found the poor 'hobbled' hen suspended by her string from one of the branches, and they cut her down in time to save her life. Did not this show sense in the male bird worthy of a higher name than instinct?

Sheep Husbandry.

SHEEP HUSBANDRY IN ILLINOIS.

MR. GEO. LAWRENCE, JR., of Wisconsin, in his late address before the Illinois Wool-growers' Association, gave a very excellent epitome of the present condition of Sheep Husbandry in the West, from which we condense the following:

Competition is the life of business. We have searched and looked Vermont, New York and Illinois over, examining and comparing sheep, and breeders have purchased the very best they could find, both rams and ewes, paying hundreds of dollars for individual animals and bringing them to Wisconsin. Thus you see the base of our breeding from three States. While much credit is justly due to Vermont, yet we assert, from experience, that the second or third generation from Vermont, grown in Wisconsin, are a superior sheep for general purposes. They have a larger carcass, are heavier boned, quantity and quality of fleece are equal, if not superior. They also withstand more hardship and exposure than Vermont stock. I know whereof I assert, for I have tried Vermont sheep. They were in fine shape. I put them in the same identical care as Wisconsin sheep in the fall, and when spring came the Vermont stock were thin and weak, and in many instances I have lost some; but after we got through one year and raised lambs in fair shape, we could finally make a starting point for a flock; but the second and third generation are, in my mind, a more durable and satisfactory sheep. We claim this especially in our rams, both for our own use and the flockmasters of the West and Southwest.

Another object we have accomplished to a certain degree is advertising our stock and calling in foreign trade. Our annual shearings are growing in magnitude and are attracting considerable attention. We do not claim that the heaviest fleece or heaviest shearing sheep are the best. What we aim for is size, robustness and quality of wool, with a fair length of staple. This we have accomplished quite satisfactorily, but still perfection has not been attained; neither do we expect to reach the goal for some time to come. Still, our rams are bred to continue this type of sheep.

Wisconsin rams are, as a rule, grown by breeders from the thoroughbred stock. Wool growers have not entered into ram raising as in some other States. This is the source of cheap rams, bought and sold in the West for full-blooded by regular traders. Some States have acquired such a reputation that anything coming from their borders is considered all right, and flockmasters continue to patronize them. I would here ask, How long will they continue to pass Illinois and Missouri by and go to Vermont for stock, when they can sell them rams cheaper and better, fully as well-bred, and all the desirable points are gained that Vermont has? The saving in transportation is an item, also, to look to. All these points are in our favor. Now what we must do is to let the flockmasters of the West know that we have these desirable qualifications in our sheep, and are ready to fill any orders of almost any magnitude, and sheep purchased of regular established breeders are really of more value to the wool-grower than buying sheep promiscuously of traders. These men work for all they can make. As a matter of course, they purchase the cheapest rams they can find and sell for the highest price they can get, regardless of breeding or giving satisfaction to purchasers. The object of the breeder is to grow a No. 1 animal, and in all cases try to give satisfaction, for in this his reputation and success are at stake. If the Western flockmasters would come directly to breeders and purchase their stock, methinks they would be well repaid.

Stock is to be the main branch of husbandry, especially in our State. If the millions of people populating the entire land must be clothed by robbing the sheep of its wool, it behooves the wool-grower to see to his laurels. The rearing

and breeding of sheep is one of the most profitable and pleasant branches of husbandry. Sheep are docile, easily handled, requiring but low fences, will live on shorter feed than other stock, will procure a living on pasture early in Spring and late in Fall. If we wish to consider whether we shall raise mutton or wool, we must adapt the kind to the demand and location. For mutton, the improved English varieties are without a superior. If for wool, the Merino and their crosses have no competitor: they are staple and standard stock.

Wool has a vast and more universal consumption than mutton, because it is a prime necessity of life to every man, woman and child outside of the tropical zone.

The Merino endures the vicissitudes and extremes of weather better than other sheep that approximate to it in value; its range extends throughout the temperate zone; on the mountain and in the valley it thrives alike. Now, as we sheep breeders are considered among this vast number of human beings populating this vast country, and by occupation classed as agriculturists, and as this is the Centennial year, it behooves us to use our utmost endeavors to place on record in history a worthy example and name for future generations. Our occupation is as important and useful as any branch of business in our land. We can consider ourselves producers (as well as consumers.)

This Merino Sheep Breeders' register is an important end to be obtained, and we must not half way do the affair, but so frame it that it will be worthy the pages of history, that it will be perused by future generations with interest and instruction. There is no reason why Illinois and Wisconsin should not go hand in hand in this matter. Let those two States be to the West and Southwest what Vermont has been to our States. We have not only breeders qualified and as interested as old Vermont had, but we have got the sheep, and business is stamped on every breeder's brow.

As to the best mode of reaching the flockmasters of those vast plains of the great West, it is in my mind through our organizations, such as you are honored with in Illinois, and I am glad to say that we have made a slight move in that direction in Wisconsin. They will hear of our doings and see our records, and it behooves the breeder to keep the ball running. It matters not how prices may run, high or low, our breeding must receive the most careful attention, that we may keep up with the improvements of the age. So when one hundred years more roll around our record will equal, if not surpass, any record of other occupations.

Improvement in breeding sheep has reached a high standard since 1812. But if this business keeps pace with the times, what can we look for or expect one hundred years from now? What little time we have to use let brain power work to produce the greatest amount of good, clean wool from an individual sheep.

Arboricultural.

THREE WILLOWS.

The name Willow is very apt to call up, at first thought, the weeping, or so-called Babylonian variety. Visions of green banks and islands, fringed with pendant branches reflected in the water, come up naturally with the term; but the members of the family are really quite numerous and diverse in character, utterly unfitted, in many cases, for either street or lawn trees.

In the habit and office of shrubs, however, experience will always prove them valuable, and it is of three well-known, ill-appreciated kinds, thus used, that we wish to speak. The Laurel-leaved Willow (*Salix pentandra*) is a vigorous plant, of erect, spirited nature, healthy, clean and straight. The leaves are broad and large for a willow, as suggested by the familiar name. All soils seem to suit it, and, like its companions, it is readily propagated and grown, and capable, when pruned, of retaining its beauty many years. A very suitable position for its employment is in hedges, difficulties found in a rampant nature being easily overcome by intelligent pruning. Unlike the other two, the system adopted should be that applied to the Privet, *i. e.*, to cut in hard on planting, and, after two years, free from half the young wood made by the past growth. The desired hight attained, every other year the wood of these two seasons must be removed back into the older growth, to renew a symmetrical habit.

The Rosemary Willow (*Salix rosmarinfolia*) is remarkable, both as shrub and tree, for its small, delicate leaves, elegant growth, and perfect curves. In vigor, it does not equal the Laurel-leaved, but is strong enough to require judicious pruning. The method used, contrary to the treatment of the Laurel-leaved, is preferably that of the *Weigela* type, being simply the removal in winter of wood now two years old, accompanied by a light clipping for the sake of symmetry. Thus managed, it is a valuable, interesting variety, notwithstanding the fact that many esteem it worthless, except when grafted high, forgetful that pruning is alike necessary for permanent beauty, to the tall standard and the lower bush.

The Variegated-Leaved Willow (*Salix caprea-tricolor*) is a variety of the well-known Goat Willow, used as a stock for the Weeping Kilmarnock. It is a good grower, healthy and graceful, and its finely-variegated leaves waving in the breeze, lend a pleasing diversity to the hedge or group. All three mentioned varieties should occupy a rear rank, next the fence, fronted by lower-growing families.

Viewed as shrubs or low trees, they have most estimable qualities, and it is only because people do not know, or forget, what the office of the pruning-knife may be in competent hands, that we hear complaints of their coarse and unmanageable nature. SAMUEL PARSONS, JR.

FIG. 3—COLEUS, HER MAJESTY.—(See first page.)

WHIFFS FROM CANADA.—APPLES AND HICKORIES.

THE season in this Province of Quebec has been unusually pleasant and open. Pansies in the garden at the close of November and no severe frost up to that date. A large surface of ground has been plowed, and the ditches that have lain so long overgrown with rank weeds and choked with rubbish have been reopened and cleaned. Farmers say they have done more ditching this season than for a dozen years, and its utility will be seen, let us hope, when the spring comes and the melting snow and warm early rains overflow the land. What a difference one finds in neighbors in this co-operative employment! One man, with pleasant, genial manner, will shoulder his pick and shovel and begin to work with zeal and a knowledge of the business, while another loiters along about the middle of the day or sends his poorest hand in his place.

As I write, a whiff from the north gives a warning of snow near at hand, while the heavy clouds, tinged yet with light, are sure indications of a storm. But we are satisfied to see a change now, since our autumn has been so fair, and in the well-built houses that in Canada are constructed to protect us against the weather we can pile on the logs and defy the wintry winds. Then is our mood the truest to criticise and admire the different varieties of apples that are brought from the cellar and to decide by their keeping qualities what varieties to plant in the spring. In Canada we are greatly in need of a good winter apple of fine flavor, as well as keeping qualities, combined with hardiness. The varieties grown here and in the Western Province, although firm and keeping sound till May, lack the fine, sub-acid juiciness of our autumn fruit.

We have had some trouble in our attempts to raise Hickory trees, and this year we have adopted a primitive method of planting, which, if successful, will have the merit of being easy. One pleasant Saturday morning in November the boys, with papa, started for the woods, carrying a bag of sweet hickory nuts, and while papa made holes with a crowbar in the green sward in front of the woods (keeping the line straight across lots), two of the lads dropped in the nuts, and a third followed with a hammer and beat the earth hard over them to cheat the squirrels. I cannot tell you until spring if they will grow; but as these trees are in demand to send to Europe, it is worth while endeavoring to supply them, especially as they are seldom found on nursery catalogues.

We packed and forwarded to Germany this fall a lot of nearly 200 Hickory trees, but being procured from the Indian woods, their roots were large and required a great deal of room, making the shipping expensive and their success doubtful. If the RURAL knows any safer, surer plan, we shall be happy to learn.

ANNIE L. JACK.

The Vineyard.

THE SOUL OF WINE.

PERHAPS it is rather straining a point to talk of the soul of the juice of a fruit, but the Galaxy talks of the "Soul of wine" in this wise:

It is difficult to describe the soul of the human body, and it is almost as difficult to describe the "boquet," for it is the soul of wine. It is an aromatic flavor which constitutes one of its chief excellencies, and gives the liquid its especial character. There is a certain degree of mystery concerning the soul of wine which so far has not been satisfactorily determined. Most wine makers believe, however, that this aroma with which the wine is impregnated, is born of the skin of the grape, and this belief has given rise to a practice existing since many a day of hanging a bunch of ripe and well conditioned grapes in the cask until fermentation ceases. This rich perfume and flavor differs according to the different kinds of wines, appearing in some like the taste of violets, in others like that of raspberries or strawberries, or combining together something analogous to the three. Of the most perfect in this way of the rich perfect wines of the Gironde, are Lafitte, Chateau Margaux, and Haut Bryon; and of the Cote d'Or, are such as Richebourg, Romanee Conti, Clos Vougeot, and Chambertin. But to describe the "boquet" as resembling the perfume of any flower, and the taste of any fruit, gives only a suggestive idea of what it really is. According to a discovery of Liebig, it comes from the presence of a small portion of the etherial substance which he calls œnanthic ether. It appears to affect the strength of the boquet, although it is of infinitesimal quantity, but the characteristic of the boquet still further depends on a little volatile oil which the wine also contains. This approximate explanation is the best which has yet been given of this peculiar vinous flavor over which epicurian poets have so long rhapsodized. The cunning mixer of adulterated wines may produce something which will deceive the ordinary palate in every other quality belonging to it save that of the "boquet."

The "bee's wing," the "thick crust on the bottle," and "the loss of strength from great age," and all other signs of quality may be imitated more or less successfully, but the mystery which surrounds the chief virtue of wine, will probably forever remain veiled, happily for those who drink it.

VINE STOCKS AND PHYLLOXERA.

A COMMUNICATION made by M. BOUTIN to the Academy of Sciences, Paris, relates to the analyses of several varieties of American Vine stocks, resistant and non-resistant to the Phylloxera. He has found in all American stocks a resinoid principle. It exists also in French stocks, but in quantity a half less than in the resistant American stocks, and a third less than in the non-resistant. He accounts for the resistance by the presence of this principle in a proportion not under 8 per cent. in the entire root, and 14 to 15 per cent. in the bark alone. The puncture made by the insect, while causing nodosities on the root, is cicatrized by exudation of the resinous produce, and this prevents loss of the nutritious juices of the plant. No such cicatrization occurs in the non-resistant stocks, the resinous matter not being abundant enough. Perhaps the malic acid in the roots of American Vines also contributes to their resistance. The extract is from a communication made to th Academy of Sciences, Paris.

The Apiarian.

FACTS AND FANCIES FROM THE ROCKY MOUNTAINS.

J. E. JOHNSON writes to the Bee-Keepers' Magazine, from Utah, giving some hints in regard to bee-keeping which may be of value to our readers residing in those regions and probably elsewhere.

Much has been said, and so long as our race exists, and bees make honey, much will be said in regard to the management and habits of bees, for "knowledge will increase," and man be learning something constantly and seeking out and inventing new modes and ways, and often the new experiences show new modes better than those before practiced. Some years ago when bees were worth $100 per colony here, I obtained one hive and began my schooling as an apiarian, and to look back now, my course seems to have been very foolish and I often wonder how I could have been so silly. Although from that one colony I have, in eight years, made over four hundred, had I acted wisely I might just as well have made one thousand. My great anxiety to increase my apiary led me to multiply by division so much that my colonies were nearly all weak; consequently they fell victims to moth, robbers, and starvation, and on an average I would annually lose half of the whole number every winter. Time and experience have brought their wisdom, and now I would not think of taking either honey or brood from any but full hives, the result being little or no less.

I am often asked the best preventive to moths, and the answer is simple and short; keep your colonies strong, and plenty of stores. If the colony is numerous and strong, it will effectually resist the encroachments of the moth as well as that of the bee robbers, and if the colony has large supplies there is no danger of starving, freezing or being weak in spring when the flowers come and the apiarian desires a strong force of workers.

The key of success in bee-keeping is in keeping your colonies strong and giving them plenty of forage flowers to work on. In an experience of eight years I have found nothing superior to Mignonette, for bees to work on, either for quantity or quality of honey. I believe that one acre of this plant will employ more than one hundred colonies of bees most amply. The Melilot clover and great American bee plant come next as honey plants, and for late forage the *Lynosyrus Graveleus* is superior to anything here, and grows in abundance in most waste places. A beautiful amber honey and comb is made from this plant, for nearly two months. The *Algeroba glandulosa* or Mezquit is a great bloomer and is heavily worked by the bees for both pollen and honey, but this lasts only about a month, though it frequently blooms twice in the season.

To inexperienced bee-keepers I will here drop a hint that may be of some value, and save the lack of many a queen if the suggestions are heeded. In making a new colony, or to supply a queenless hive, *always* be sure to take with the frame of eggs *plenty of young bees*, never less than a pint, a quart is much safer, unless there is plenty of young bees you will never find a queen made—the old bees never perfect queen cells—the young give them fresh eggs every week in the season. Remember that the young bees are the wax workers, while the old bring supplies.

As winter now approaches look through your hives and see that there are no empty frames near the brood nest, but if there is to be a vacuum let it be on the side or sides.

HONEY PLANT.—Prof. A. J. COOK of Michigan Agricultural College says that the following plants have been tested the present season and found to furnish excellent forage:—Mignonette, borage and black mustard. Sunflowers are unworthy cultivation, while the Rocky Mountain bee plant blooms too late to be valuable where there is plenty of fall bloom native to the region.

Scientific and Useful.

THE PHILOSOPHY OF MORALS.

It is generally conceded that there is more of good than evil in the world; that each individual, however vile and wicked he may be, does in a lifetime more commendable than reprehensible deeds.

The causes that impel us to act have been subjects of discussion from the days of PLATO and ARISTOTLE to the present time. Different theories have been promulgated, each having strong supporters, many of whom desired to add thereto ideas of their own, until, instead of the original two, there are perhaps two score, all of which may, as to their general teachings, still be classed as two—the Utilitarians and the Intuitives.

The first hold that all actions are good or moral as they conduce to the happiness of mankind, and that observation and experience are the only guides we have to aid us in deciding what is right or wrong for us to do, and emphatically deny the existence of any moral faculty or sense which enables us to judge between good and evil, or assures us of any rule of duty, or points out any course of conduct. This party is also known as the Selfish, the Epicurean, and the Inductive, and numbers among its later supporters HOBBS, BENTHAM, MILL, and many others.

The other party, known as the Intuitive Moralists, or otherwise the Stoical, the Sentimental, and the Independent, hold that some innate, natural power, implanted in us by the Creator, enables us to know that such qualities as benevolence, honesty and truthfulness are virtues, without reasoning or argument, and without examination of their effects on individuals or on society. These views are supported by such writers as HUTCHESON, CUDWORTH, STEWART, REID, BUTLER, and others.

Mr. LECKY, in his History of European Morals, says, "The business of a moral philosophy is to account for and to justify our moral sentiments, or in other words, to show how we come to have our notions of duty and to supply us with a reason for acting upon them." And again, "A theory of morals must explain, not only what constitutes duty, but also how we obtain the notion of there being such a thing as duty. It must tell us not merely what is the course of conduct we *ought* to pursue, but also what is the meaning of this word 'ought' and from what source we derive the idea it expresses.' Clearly none of the writings of the ablest men on either side of this great question were able to account for our moral sentiment o to explain the meaning of 'ought.' Assertions were plenty, but arguments in the highest degree logical, based on these assertions, failed to convince, because the soundness of the premises was doubted.

HOBBS says, "Obligation is the necessity of doing or omitting any action in order to be happy." Says BENTHAM, "Nature has placed man under the government of two great masters—Pain and Pleasure. It is for them to point out what we ought to do, as well as what we shall do." In MILL'S Utilitarianism we read, "Happiness is the sole end of human action, and the promotion of it is the test by which to judge of all human conduct." LOCKE asserts that "good and evil are nothing but pleasure and pain, or that which occasions and produces pleasure and pain to us."

The Intuitive philosophers, on the other hand, are no less positive in their assertions. They deny that there can be any merit or goodness in a selfish action, no matter what may be the result. CUDWORTH taught that there was some particular faculty of the mind that enabled us to distinguish truth from falsehood, and the different writers of that school, varying as they do as to details, mainly agree with the teachings of PLATO, that there is an innate power, whether derived from the experiences and conclusions of a pre-existing state, or specially bestowed upon man by his Creator, which is competent to distinguish between good and evil.

The believers in Phrenology think they have the true solution of this vexed question. They hold that all things, whether they be physical, organic or spiritual, are governed by laws, and that these laws, which are innate, universal and unbending, are in harmony with the whole constitution of man, in which the moral and intellectual powers hold the supremacy. But they do not decide if innate ideas are conferred directly by the Creator, or if they are only the effects of accumulated experiences, inherited from ancestors.

They teach that the brain is the organ of the mind, and that the different faculties have each a definite location; that concordant faculties are located contiguously and all may be divided into three classes—the Animal, the Intellectual, and the Spiritual, and these last subdivided into the dealistic and the Moral. In the latter group and located in the crown of the head are Benevolence, Veneration, and Conscientiousness; that the office of Conscientiousness is to incite man to the performance of that which he believes to be right, leaving it for the Intellectual faculties, guided by Reason and Experience, to decide what is right.

They hold that all the faculties are inherent, implanted by the Creator, and that the happiness of man consists in their satisfaction, and that the result of the violation of any of the Natural laws is evil.

Thus, it will be seen, this new Philosophy of Morals, while it includes the ideas of both the Utilitarians and the Intuitive schools, agrees entirely with neither, but furnishes a platform on which all may stand in harmony. It tells us the "course of conduct we *ought* to pursue" is that which is approved of by the whole moral and intellectual faculties, fully enlightened and acting in harmonious combination; that the meaning of the word ought is duty, and that we derive the idea it expresses from the natural laws of our constitution. And it teaches us that the highest duty of man is to do that which will in the greatest degree insure his own happiness, and that this can be done only by using all the faculties of his mind and all the powers of his body in promoting the physical and spiritual welfare of those about him. These principles are more fully set forth in the books noticed in connection herewith, which are commended to the attention of all interested in the subject.

PROTECTION AGAINST SPORTSMEN.

A CORRESPONDENT of Our Dumb Animals in comparing the laws of California with those of Massachusetts in regard to the protection of game, says:

While there are general laws in California, protecting the birds and other game during certain seasons of the year, at San Francisco the local legislature extends its protection, through all the year, over the birds within its own jurisdiction, in which Oakland, across the Bay, joins; and during a recent visit it was a constant pleasure to me, while passing between the two places, to observe the water-fowl, as we rode over the wharf, more than a mile long, from Oakland to the ferry, which swam directly beneath the car windows, in great multitudes with perfect freedom from fear. They literally swarmed in the shallow water, and as the cars thundered along, the little creatures would cast o r eyes up in roguish defiance, as if they understood all about the law, and were tempting the passer to its violation. There were enough ducks there to drive a Boston sportsman crazy, but never a gun disturbed their peaceful enjoyment. Beautiful gulls, too, enjoyed this immunity, and they would settle upon the posts of the ferry slip, almost within the reach of hand, never doubting that man was their best friend.

Such confidence to me was delightful, and I could not help contrasting this state with our own destructive custom of shooting such little creatures wherever we meet with them. As I write, there is a boy in the street with a bit of rock in his hand, his eye intent on a beautiful pigeon whose harm he intends. It illustrates exactly this cruel disposition to destroy. The possessors of private grounds in California, also take pains to protect the birds against sportsmen and I frequently saw, over the gates to such grounds, "No Shooting Allowed!" And the birds seemed to appreciate it, crowding the precinct with their numbers and making the air merry with their songs. On a visit to one of these places one little California lark preceded us, step by step, for a mile, perching himself upon a fence, a little ahead, and singing the most joyful song, of welcome, as it seemed, that I had ever heard. It was a gush of most ecstatic melody that he poured, without a note of fear in it, and he appeared as if eager to speak for his race, out of his own happy heart, and ask our attention to their blissful privilege.

There is another class of dumb animals over which the laws of California extend protection: the sea-lions which tenant the rocks in the vicinity of the Golden Gate. These huge monsters live in perfect freedom within easy rifle range of the shore, and no one dare molest them. There are hundreds of them upon the rocks all the time, and they play or sleep, in perfect security without a fear of molestation, in full view of the multitudes who flock to see them. There was an attempt made last winter to repeal the law protecting them—on the good ground, too, that they were great consumers of fish which was needed for the people—but the attempt was futile, and, being ante-pioneers, they are sustained a while longer in their original possession.

Visiting the Seal Rocks with me, for the first time, was a Bostonian, who, on seeing the monsters, as they lay there at easy distance, cried, with the true instinct of the sportsman: "If I only had a gun!"

SCENT IN DOGS.

A WRITER in Chambers Journal tells a very interesting story of how a dog in India found his way home through the aid of keen scent:

Many years ago, when in India, I had a hound of a kind of cross-breed, which in India is known as the Polygad. These dogs are unsuited for coursing, but make splendid companions for long and rapid journeys on horseback, being able to go great distances without fatigue, and caring little for heat. Phakree, (beautiful), for such was her name, had been my companion for years, and during the time was seldom out of my sight. When she had become old and unable to keep pace with me in my gallops, I parted with her to a friend whom she seemed to take a great fancy to, and who then resided on the Mahableshwur Hills. My own station, Poonah, lay about eighty miles east of Mahableshwur, and is separated from the hills by three ranges of lofty mountains, which in those days were covered with dense jungle. On the day of my departure I cautioned my friend to keep Phakree securely chained for some days, so that she might not follow me. On this occasion—for I had been the journey once or twice before—I left the main road and selected an unfrequented bridle-path for my route, in order that I might enjoy the beautiful mountain scenery through which it led.

I had reached Poonah, and had been there for several days, living in my tent, when one night I was roused by the howling of a dog under my bedstead. I struck a light, when, to my astonishment, there was poor Phakree, with a collar round her neck, and a few links of chain hanging to it. A letter I received next morning from my friend gave me to know that she had broken loose and run away, and that, although he had made every search for her, she was nowhere to be found. He regretted that we should never see her again. She had been four days on her journey; and her famished condition, and the numerous wounds she had on her, showed the privation she had undergone, and the treatment she had received from the dogs of the different villages through which she had passed. The poor creature had no doubt scented me the whole way, for had she followed or accompanied any one, she would have been cared for and protected. We never parted again.

The Garden.

FALL PLANTING OF HARDY VEGETABLES.

SPRING is the season in which most persons make their vegetable gardens, planting both tender and hardy kinds at the same time. While, as a general rule this season is the preferable one for sowing seeds, still there are many kinds of hardy perennial vegetable roots which may be set out in the fall, thereby saving valuable time in the usually more hurried period named. There is also another good reason for fall planting of the hardy vegetable roots, and it is that owing to their usual early growth in spring they are more liable to injury from transplanting at this season than when in a perfectly dormant condition as they always are in the fall. Among the many kinds of plants which may safely be set out at this season, we name the following with some hints as to the method of propagation and culture:

ASPARAGUS.

The roots of this plant are generally set very deep in order to allow of cutting the stalks several inches below the surface, to accommodate a very foolish notion that the white uncolored stems are better than the green, when in fact they are unhealthy and scarcely edible. For home use, or a market where common sense prevails over ignorance and prejudice, the roots need not be set deeper than four to six inches and at this depth the annual top-dressings of manure applied to the surface, will reach them sooner and the sprout appear earlier in the spring. Besides this, it is not necessary to enrich the soil to so great a depth if the roots are set shallow, as when placed a foot below the surface.

Another mistake frequently made in planting out asparagus roots is in placing them too near together. Two by three is near enough even for garden beds, and in the field the rows should be four feet apart and the plants two in the rows. Roots one or two years old are generally considered better than older, although those who are in haste to have asparagus to eat, get the largest and oldest roots to be obtained.

RHUBARB.

Fall is the best time to divide large stools or clumps of roots as the leaves start very early in spring. In dividing the stools for planting only a single crown should be set in a hill. The crowns of the roots should be covered some three or four inches in heavy soils and a little deeper in light. Like asparagus there is little danger of making the soil for rhubarb too rich, because the more rapidly the plants grow the more succulent and tender the stems. There are many varieties in cultivation, but the Linnæus is now the most popular among our market gardeners, but the Colossal and Victoria are probably equally as good, and the difference is mainly in the color of the stalks and leaves. Cahoon's Mammoth is the largest variety known, but it is rather coarse and not quite equal to the former in flavor.

PIGEON BERRY.

The Pigeon Berry, (*Phytolacca decandra*), also called Poke and Garget root, is not often planted in the vegetable gardens of this country, still it is a valuable esculent, and deserves to be more extensively cultivated. It will thrive in almost any soil and situation and may be readily propagated by dividing the old roots or from seed. The young shoots are used as a substitute for, or in the same manner as asparagus which they resemble in taste. The sprouts may also be cooked in the same manner as sea-kale, or as spinach for greens. There is also an annual variety, the *Phytolacca*, known as *P. esculenta*, but the former is the preferable species on account of being a perennial.

HORSE RADISH.

This is another well-known vegetable used as a condiment with meats the roots of which are perfectly hardy and may be planted in the fall. It is a valuable plant but quite generally neglected in farmers' gardens being usually found in some corner over-run with weeds. If planted in good soil and carefully cultivated the roots grow quickly and large and are much less likely to be stringy and tough than when grown slowly and in poor land.

Horticultural.

WILSON'S EARLY BLACKBERRY.

THE impression is very general that the Lawton Blackberry exceeds all others in size. But this mistake is readily accounted for by the fact that the Lawton was the first of these large berries introduced, and its appearance created so much notice that the name was firmly fixed in the minds of the public. It has gained such a firm hold that in many places all large blackberries are called or classed as Lawtons, and yet in the New York markets probably not one-third of the mammoth blackberries exposed for sale are of the Lawton variety.

The berry mentioned at the head of this article cannot be called a new berry, and yet to many the name is probably almost unknown. It deserves, however, far greater notoriety than it has yet attained, as it has merits that may well entitle it to be placed in almost every garden. It is called *early*, not so much on account of its being a *very early* variety, as from the fact that it ripens its entire crop very early in the season, within a space of two or three weeks, while the Kittatinny and Lawton extend over nearly twice that time. This ripening of the entire crop early in the season makes it of especial value to those who are growing fruit for market and who wish to obtain the highest prices. They are very largely planted out for this purpose in some sections of the country, and prove one of the most profitable crops.

In habit of growth the Wilson's Early is very similar to the other kinds mentioned, though frequently the canes are more slender, allowing them to be bent down to the ground and kept in place by pegs or stones, if severe winters are feared. The berries are fully ripe as soon as they become black, are sweet, juicy, and in every respect first-class for eating. Some berries have been grown of enormous size—one, the past summer, measuring very nearly, if not fully, two inches in length. It only requires about a dozen of these superb berries to make a tempting dish that but few will be found to resist.

Plantations are made in the fall or early in the spring, placing the plants three feet apart and in rows seven or eight feet distant from each other, or in hills five or six feet apart each way.

Malden-on-the-Hudson, N. Y. R. H. HAINES.

[The Wilson Blackberry is all that is claimed for it by our correspondent, but the plants are not hardy north of the latitude of this city, and frequently they are winter-killed even considerably further south.—ED. R. N. Y.]

Domestic Economy.

THE KITCHEN.

The following excellent advice about Kitchen and how to keep them clean, appeared not long since in Scribner's Monthly:

The first consideration in a cooking room is cleanliness. Tried by this test papered walls are an abomination in such a place. You can not darken this room through parts of the day in summer, as you do others, and consequently fly specks will be numerous. These walls absorb the kitchen odors and steam, and the smoke rests lovingly upon them. If creeping things get into the house, they are sure to insinuate themselves into the paper on the walls. Hard-finished walls are more cleanly, for they can be washed: but unless they are finished better than in the kitchens we have seen, they soon look dirty, and this is the next worst thing to being so; for such finishing soon becomes discolored and "splotchy." There is nothing that will compare with the old-fashioned whitewash, pure and simple. The color wash may give the walls a prettier tint, but it must be put on by a practiced hand, whereas whitewash may be applied by any one, whenever a dirty spot makes its appearance.

It is true unpracticed hands do not apply the brush as evenly as could be wished, but a few streaks more or less don't matter; we can all see streaks are white and clean. Don't have the wood-work painted: don't have anything painted. Things in a kitchen will get soiled. It follows they must be cleaned. Soap is a foe before which paint invariably quits the field. Very soon the color will be off in spots, and nothing less than repainting the whole room will ever make it look clean again. It is still more objectionable to leave the wood in its native state. It requires frequent scrubbing to keep this clean, and even this process will not suffice to keep all sorts of wood in good condition. Some woods actually blacken under the scrubbing brush. But if the native wood, even common kind, is well oiled and varnished lightly, the room will be prettier for it, and with very little washing the wood-work can be kept sweet and clean.

SELECTED RECIPES.

Roast Goose, German Mode.—Rub the goose over night with salt, pepper, sage, thyme and sweet marjoram, inside and out; in the morning prepare the dressing as follows:—A large handful of stoned raisins and Zante currants to bread-crumbs, a couple of sour apples chopped fine, and one mealy potato, with butter mixed in, and all well rolled together; but put no spice in the dressing. For the gravy, boil the giblets in a little water and mash the liver in a spoonful of flour, chop the gizzard, stir these in the liquid they were boiled in, add it to the gravy in the dripping-pan, sprinkle in a little thyme, sage, and sweet marjoram, and it is done. Serve the gravy separately. When the goose is cooked and served, garnish it with sliced lemons, and a few sprigs of green parsley.

Roast Goose.—Make a dressing of two ounces of onions, an ounce of green sage chopped fine, a coffee cup of bread crumbs, a little pepper, salt, and the yelks of two eggs; do not quite fill the goose, but leave room to swell. Roast two hours and serve with gravy, and apple sauce.

Boiled Goose.—Dress and singe it, put it into a deep dish, cover it with boiling milk and leave it over night. In the morning wash off the milk, and put the goose into cold water on the fire; when boiling hot take it off, wash it in warm water, and dry with a cloth. This process takes out the oil. Fill the body with a dressing of bread crumbs seasoned with pepper, salt, butter, and two chopped onions if relished, and a little sage. Put the goose into cold water and boil gently until tender. Serve with giblet sauce, and with pickles, or acid jellies.

Roast Pig.—With a small sharp knife, take out the eyes and tongue, cut off the feet, trim the ears, and clean it both inside and outside thoroughly. Then wash well through several waters, and dry it with a clean towel. Rub it inside and out with salt and pepper. Make a stuffing, with six powdered soda crackers, one tablespoonful of sage two of summer savory, one chopped onion, half a pint of rich milk, (cream is better) two eggs, with pepper and salt. Mix these together and stew about fifteen minutes. Fill the pig with the stuffing and skewer closely. Put the pig to roast, with a pint of water, and a little salt. Let it roast gradually; and in order to make it brown nicely, rub butter over the pig. Baste frequently with the drippings while roasting. Boil the liver and heart, chop fine, and add them to the water in the dripping-pan to form the gravy.

Roast Pork.—For roast pork make a stuffing as for roast pig. Take the leg of pork, of seven or eight pounds in weight, and raise the skin off the knuckle, and put in the stuffing, then make deep cuts in the thick part of the leg, and fill them. It must be floured over, and a pint of water put in the pan. While roasting, baste it often with the drippings. Cook about three hours and a-half. Skim some of the fat from the gravy, add a little flour, and let it boil up. Serve in a sauce-tureen.

Spare Rib of Pork.—Wash and dry your spare rib, and season it with salt, pepper and powdered sage. Put it in a pan and set it in a moderate oven. Baste it well while roasting. Serve it with egg sauce, or white sauce.

TWO SCOTCH RECIPES.

The following are from a correspondent of the London Agricultural Gazette:

Sago Cream Soup.—An old fowl that is only fit for the stock-pot makes delightful stock for this soup, and it may either be boiled till every particle of goodness is extracted, or if a less strong stock is wanted, it may only be boiled till tender, and the meat afterwards used up in some of the made dishes where a white meat is required. Add to the stock while boiling, some whole white pepper and a blade of mace. Strain and skim the stock: this last operation is best done with what is called kitchen paper, a most useful article, and of which a supply should be at the command of every cook. Lay the paper on the top of the stock and draw it off; the fat on the top will adhere to it, and the process should be repeated till the paper comes off free from grease. For every 2 quarts of stock take 3 ounces of sago or of tapioca, wash it in hot water, and boil it in the stock for one hour. Break the yelks of two eggs in a basin, and add to them half a pint of cream or milk; pour into it gradually a little of the hot soup, then turn it all into the remainder of the soup and heat it up, taking care it does not boil. The stock for this soup may be made of rabbit, or of veal, or of a mixture of all three.

Beef Steak Pudding.—Cut up 1½ pounds of beef into neat steaks. Dip the chopper in cold water and beat them a little to flatten them and make the meat more tender; roll them up with a little pepper and salt inside. Line a pudding basin with a suet crust made in the proportion of 6 ounces of suet to ¾ pound of flour. Take care to put the crust quite down to the bottom of the basin, or the pudding will break. Cut the crust off even with the top of the basin, lay in the meat; if liked, add some chopped onion, half fill the pudding with cold water, cover over the top with a lid of paste reserved for the purpose, having previously wetted, or better still egged the edges of each. Tie up in a pudding cloth wrung out of boiling water and sprinkle with flour. Boil for at least three hours. A couple of sheep kidneys sliced and added to the pudding, very much improves the flavor of the gravy, and, if liked, three-quarters of a teaspoonful of baking powder may be added to the crust; but it should be borne in mind that whenever baking powder is used, the utmost expedition in finishing up is necessary, as fermentation commences from the moment the water is added.

Hygienic Information.

DIETETIC BUNCOMBE.

That people love to be humbugged is an established fact, and that nine persons out of ten place implicit confidence in nearly everything they see in print, we have every reason to believe. Now, in an age characterized by so much shepticism, it is certainly refreshing to note this whole-souled fact; but, on the other hand, it is to be regretted that such a commendable trait, which the average American clings to so tenaciously, should be born of sheer ignorance.

Probably in no other way are these virtues so detrimental to the general welfare of a confiding community as in the simple matter of diet. Take, for instance, the enthusiastic hygienic reformer. He leads an army of countless thousands,—all dyspeptics—who look to him for aid and succor, a deliverance from the slough of horrors into which they have descended. His views are necessarily very radical, and his theories erudite and profound. From his massive brain scintillate ideas which are only conceived in the minds of great men, and the mighty engines of the press are kept busy deluging the world with a mass of hygienic advice in a form easily swallowed.

By way of illustration, let us take the latest effort: The breakfast must be very light—a small quantity of oat-meal, with occasionally a cup of weak coffee. For dinner, potatoes, *a la* Lewis, and a slice or two of toast. If the patient is weak, and a stimulant is desired, the savory odors of a dish of beefsteak and onions may be wafted to his olfactories, provided it is placed at regulation distance. We have taken a little liberty with the phraseology, not, however, in hopes of rendering the text more nonsensical or absurd.

Now this is all mere bosh, and yet there are countless numbers of people who cheerfully and resignedly take this slow but efficacious method of shuffling off this mortal coil, simply because Mr. So-and-So recommends it. Likely as not while those worthies are tormenting both flesh and spirit with this health-insuring regimen, the author is laughing in his sleeve over a sumptuous repast in which solids and various other indigestibles form not an inconsiderable element. It is very strange to me that persons, who actually ought to know better, will persist in experimenting with every new-fangled notion. Common sense everywhere but in the right place!

Now, without being understood as undervaluing the benefit derived from a habitual use of oatmeal (which, in its way, is a most excellent article) for a systematic course of diet, we do most decidedly object to see well-meaning people gulled by a parcel of specialty hobbyists, who gain a rather precarious reputation at their expense.

Dyspepsia, unlike a simple attack of indigestion, *will not be patched up*, and as to those who have about as much idea of the stomach, its uses and abuses, as a countryman has of the arrangement and appointment of an ocean steamer, the sooner they begin to appreciate this fact the better. The process of bolting and gormandizing will decrease in proportion as they become possessed of sound, practical knowledge regarding the subject.

To a certain class who hold that ignorance is bliss, it will still remain a mystery why they should suffer and be tormented. Ignorance, in this case, simply means bliss to the extent of being happy over the fact that there are yet a myriad unwritten experiments to be tried, and advice, as yet unprinted, by the bushel. But ignorance of the law excuses no one. It is our duty to acquaint ourselves with such matters as concern the preservation of health. Especially so is this the case with the young, who should be thoroughly instructed in all that pertains to the ordinary matters of hygiene. They should, at least, be made aware of the fact that the stomach does not occupy the entire human anatomy, and, in after years, they will be spared the often mortifying and ludicrous sight of an attempt to locate a distress in that organ. Observe for yourself.

Bear in mind that just so long as you delegate such simple matters to the learned "M. D.," you must be content to remain in almost criminal ignorance of the fundamental laws regulating human economy, and just so long will you be at the mercy of charlatans and quacks and become a receptacle for all sorts of fancies and notions.

We repeat, people suffer as much through ignorance as from any other cause. You may eat much or little, but there are extremes as well, as you will readily find out by bitter experience. Make the subject a study, and learn for yourself the why and wherefore of your ailments. There is, at least, a degree of satisfaction in the knowledge that the horrors of dyspepsia are not half severe enough punishment for a willful and knowing disregard of one's better judgment. If, on the other hand, you are content to remain as you are, tossed about, like a shuttle-cock, on the troubled sea of doubt and uncertainty, why, that is your business, not ours. You may be as quick to accept the advice you see in print as a drowning man to grasp at a straw; and yet, if coming from any other source, it would be liable to scare you. Child-like faith is a very good thing in its way, but it should be beautified with sound common sense to avoid being misplaced. There is no harm in argument of belief and trust, but let it never be said of us that we were found without a consistent and intelligent reason for the faith that is in us.

F. J. W.

REPLY TO M. D.

No, friend M. D., I never hinted nor ever believed that, as a rule, the food that is the most easily digested, or that digested in the least time, was the most healthful. If you will refer to my article in the Rural of the 4th inst., you will see that I not only do *not* advocate the idea which you seem to impute to me, but that I emphatically disclaim it. It has long been taught, and I think generally believed, that all the muscles are strengthened and enlarged by use. Those who have paid little or no attention to physiology, are perhaps not aware that the stomach, or a part of it, is a bundle of muscles. Jarvis, the publisher of a work on Physiology, says of it: "It is composed of three coats, or layers, the middle is the muscular coat. It has two layers of fleshy fibers, or strings, which run crosswise of each other at right angles." There is, of course, an amount of muscular exercise which weakens and another amount which strengthens, and though we often see it recommended to avoid fatigue, I have always believed that any amount of fatigue from which the muscles recover their full tone and power on a good night's rest is not hurtful but healthful.

Most medical men, as well as many laymen of families, are aware of the great prevalence of abdominal weakness, more especially in females, often causing displacement of internal organs. This complaint occurring mainly with the wealthy and refined, has led me to believe that its main cause is too much sitting and lying, when the abdominal muscles are almost entirely relaxed.

By taking notice, one will see that, on rising from a seat, these muscles are brought at once into play, and so kept in full play while standing, and more especially while walking. Injuries to the muscles are often caused by over-exertion, especially when accidental; but I verily believe that, in the main, more injury is done to them by the lack of use. S. B. Peck.

Industrial Topics.

NORTH CAROLINA NOTES.

We read a great deal in the newspapers of the day, and hear much said by Northern people about the shiftless manner in which the Southern people conduct their agricultural operations, which is more or less true, although poverty is a partial excuse for some of said thriftless ways. Still, I find there is something of advantage to be perhaps learned from a description of a few "make shifts" that may be a benefit to some other poor people.

The manner of making cider is to place the apples in a trough and mash them with wooden pestles of size proportioned to the strength of the operator. The platform and rack are made in the usual way, at the root of a tree which has a mortice through the body, in which one end of a stick of timber is inserted, which bears across the press, the other being loaded with stone. Tobacco is also pressed in hogsheads in the same manner. This, of course, is a very rude affair, yet where more efficient machinery is beyond one's means, this answers a good purpose. Two good hands will work out one hundred, or even more, gallons per day.

A cheap and good farm gate is made as follows: For the uprights, take poles four inches in diameter, cut one four feet long and one as long as the hight of your post is above ground; then, with a one-half inch auger, bore holes at such distance apart as seems necessary, making the holes in one to correspond with those in the other; then cut smaller poles of such length as will reach from one post to the other, sharpen to fit the holes in uprights; put in the poles, drive together snug, wedge the poles solid and the gate is complete. If the top pole is made longer and the back end inserted near the top of the upright, sagging will be partially prevented. Plant a large block at the foot of the post to which the gate is to be hung, with a hole bored one or two inches deep, in which set the foot of the upright, which should be sharpened for that purpose before the gate is put together. For an upper hinge, take a short piece of plank, or, if that is not convenient, hew down a small pole to two inches in thickness, bore a hole near one end, in which insert the sharpened upper end of upright. The hinge may be secured to the post by boring a hole and securing the hinge by a key on the back side, or if the top of the post is square, it may be fastened by a couple of wooden pins, driven through into holes bored in the top of the post.

Corn is shelled quite rapidly by means of a pine stick about three feet long, four inches wide and two inches thick, six or eight inches of one side, about the center, being studded with stubs of nails, driven at distances of about one-half inch and protruding one-quarter inch. Place one end in a basket or box, the other against the breast, grasp the ear with both hands, rasping it up and down, at the same time giving it a rolling motion.

A good substitute for a basket can be made by any one in twenty minutes, as follows: Two pieces of board, one inch thick, nine inches wide and twelve inches long; cut a few laths, or other thin narrow stuff, twenty inches long, nail the ends to one side and the two end edges of the boards at such distance apart as will prevent the leakage of such produce as you wish to handle. For handles by which to carry, nail two strips, one-half inch thick, up and down each end, two inches from the center, across those, four inches from the top; nail another piece with one clinch-nail in each, long enough to clinch on the inside; this last piece may be chamfered out on the inside to make room for the fingers. For many purposes this is preferable to the common bushel basket. If desired, it may be of such dimensions as to be an accurate measure.

HOLIDAY PRESENTS.

As the year draws near its close a goodly proportion of the forty millions of inhabitants of the United States are cudgeling their brains about Holiday Presents. They who have plenty of money and are consequently able to give whatever and to whomsoever they please, find it difficult to decide not only who shall be the recipients of their gifts, but what the gifts shall be; and on the other hand, many—and, we are sorry to say, most—are trying to solve the difficult problem, how, with their stinted means, to procure even trifling tokens for such kindred and friends as they would be glad to remember.

The custom of holiday gift-making has become much more common of late than it used to be. The old New Englander, true to the teachings of his Puritan ancestors, took no note of Christmas except to denounce its observance, and the descendants of these New Englanders who were among the earliest settlers of all the new States, following the old custom, took with them more or less of this feeling and engrafted it on their new homes. But an increase of liberality in religious ideas and a more enlightened view of Christianity have, to a great extent, overcome this, and there are now but few who do not welcome with gladness the annual return of the day we celebrate in recognition of the birth of the founder of the Christian religion and the head of the Christian church, and aid, so far as they can, in making a merry Christmas for all around them.

For the growing custom of gift-making at Christmas time, we are largely indebted to our German friends; for while our English ancestors were not wanting in their recognition of the day, never failing to decorate their homes with the holly and the mistletoe, their festivities consisted more generally in family gatherings, in eating and drinking, and the more boisterous sports for the men during the day and dancing for all at night. With the Germans it is different. The observances took a more quiet form, and the Christmas tree, with its gift-laden branches, was found in every house, and the exchanging of presents between friends almost universal.

What to give. It depends much on the circumstances of the recipients and their relations to the owner. A well-filled purse would by one be received with thanks and pleasure, while by another it would, and properly, be considered an insult. To some we would give articles of practical value, while for others we should select gifts more for their beauty and elegance than their cost or usefulness. For one class we would select what we think they need but cannot afford to purchase; for another that we know is as well able purchase as we are, something of less intrinsic value would doubtless be received with quite as much pleasure.

In selecting presents for children, it is well to consider their peculiar tastes and dispositions and, moreover, to remember that they *are* children. A dime properly expended will make a child happy as a king, when a dollar used to purchase something in which it has no interest, is wasted; and the same consideration may very properly be had in choosing for children of a larger growth. One young lady would prize a book or picture, while the next would prefer feathers and ribbons; and a young gentleman would choose—what? Now, miss, don't you wish we would tell you? Haven't you said an hundred times, it is so difficult to think of anything to present to a gentleman? It is so long since we were a young gentleman, we have almost forgotten. But we would not give him slippers, for if you do they probably will not fit; nor a pipe nor a cigar-case, as they might encourage him in forming a habit you may be sorry for one of these days. We are confident he would prefer something you have made with your own fingers and into which you have wrought your own thoughts. But it will make little difference what it is, so that he sees in your eyes that it pleases you to give it, and can be happy in believing that after a while you will give him—yourself.

Above all things, keep from your holiday givings everything that would make them appear like donations or alms-giving. Better not to give at all, than that the gifts should carry with them a feeling of obligation. Give because you want to, not because you must; give with kindness and love. Give because you feel in your soul of souls that it is more blessed to give than to receive. Then you will have what you deserve—a Merry Christmas and a Happy New Year!

WHO DARES SAY SHE WAS WRONG?

It seems to be nature's law indelibly stamped upon humanity, that it should worship something. In some instances it is the sun, in others it is the wooden idol, and in still others it is a spiritual existence. The motive of all kinds of worship is the same and neither the degrees nor the object of the devotion can alter that motive or its purity. A man may make a mistake in the object, but if the motive is there, who dares say he is wrong?

The truth of the above would have been brought more forcibly to the mind of the reader by witnessing a scene which occurred in this city during the past week. In order to advertise the changes of programme and to keep their attractions before the public, the theatrical managers of this city have established large bulletin boards in many prominent places, upon which they are accustomed to paste their play-bills. To render these still more attractive, they have acquired the habit of using for them large pictures, including portraits of star actors and actresses. Among others, at the time spoken of, was the portrait of a celebrated actress which, though unsuggested, would hardly be susceptible of being mistaken for the Virgin MARY yet, at the suggestion of the idea, such an error was just possible. Before this portrait knelt in abject devotion, making the sign of the cross, an old, decrepit woman, whose weary life had almost spent itself. Ignorance and superstition were depicted on every lineament of her face and her attitude was that of abject worship. Mistaking the theatrical portrait for that of the Virgin MARY, she had bowed herself before it and was performing the manual exercises which she had been taught in her youth were the means of grace and the salvation of her immortal soul. Unmindful of the curious and scrutinizing gaze of the passers-by, she was worshipping in the only manner known to her. While the spectators were all struck with the ludicrousness of the mistake she had made, none scoffed nor did any interfere; but the greater number were touched at the spectacle and passed her in respectful silence. They all looked behind the funny mistake and saw the sincerity of the worship and the purity of the motive which prompted it. Who dares say she was wrong?

QUESTIONABLE ECONOMY.

THERE are many heads of families who, in their anxiety to practice economy the coming year, will commence or extend it to the cutting off the family newspaper. This is what we would call poor economy, especially if the paper or papers subscribed for are really good ones, containing information of which the family stands in need. Of course we are not pleading for the RURAL NEW-YORKER any more than for the hundreds of other good and instructive periodicals of its class, but for one and all the aim of which is to make the homes of our people better and brighter by their presence. It is certainly among the reasonable probabilities that a family may get along just as well and be as happy if they should not know all about every murder or case of theft and like incidents constantly occurring in all parts of the world, but periodicals which give instructions in matters pertaining to the duties of every-day life and welfare of the laboring classes, cannot be dispensed with without serious loss.

If we throw out of the account the pleasure derived from the perusal of such papers, also their value as instructors in general, there still remains an almost universally admitted certainty that during the year some one article or paragraph will convey information to the reader worth far more than the subscription price for a twelvemonth or more. It is to be hoped that every one of our readers will think of this subject thoughtfully before deciding not to renew their subscription for those papers which instruct both the old and young members of the family. Let nothing short of a deprivation of the actual necessaries of life prevent you from subscribing for at least one good newspaper, and in making a selection chose the one which will give the most and best information upon the business pursued or the wants of your family.

RURAL NOTES.

Willow Culture.—Again we notice that there is an attempt made to get up a "basket willow fever," and the old story of five millions' or more worth of willow and willow-ware being annually imported, is going the rounds of the press. Now as a word of caution, we suggest that before farmers or others invest heavily in willow culture, they look into the subject very carefully and mark the difference in the price of labor in this country and abroad, whence we obtain the imported article. The cost of freight across the Atlantic and other unavoidable expenses of bringing over willow-ware, scarcely make up for the difference in the price of labor on the opposite sides of the big pond. We can raise basket willow enough in any one of our States to supply the whole world; there is, however, an "if" and a "but" in the way, which have been very troublesome to those who went into the culture of this plant in years past.

The Right Name.—There is a movement on foot to compel the manufacturers of oleomargarine butter to stamp the article by its right name, in order that the purchaser may know just what he is buying. We second this movement, and would not stop with butter and cheese, but have it extend to all articles placed on sale, from a pound of cheese up to silks and broadcloth. If people will not be honest through principle, let us have laws to compel them to be, and see how the thing will work for a few years, if not perpetually.

Another Discovery.—One DANIEL M. COOK, of Ohio, claims to have discovered a new and inexhaustible source of electricity, and he proposes to light cities and furnish almost unlimited power for driving anything from a needle up to a bar of pig iron, through space out into regions beyond the influence of gravitation. It is to be hoped he will not go into partnership with the "KEELY Motor" man and keep us waiting another hundred years for an exhibition of his wonderful discovery.

A Book About Cats.—It is announced in "Our Dumb Animals," that a woman in an adjoining State is about to publish a work on Cats; but whether in favor of or against, we are not informed. We will venture to say, however, that it is in favor of the feline race, as that is the only truly womanly view to take of the subject, and she may count us in as a subscriber in advance.

The New Crop.—The Department of Agriculture reports that the cotton crop will fall somewhat short of that of last year, but will rank among the largest crops ever known in the country. The season has been favorable for gathering cotton, except in North Carolina. The fiber is of superior quality in the Southern belt and the estimated number of bales is 4,202,100.

RURAL BREVITIES.

MARINE INTELLIGENCE.—The mouth of the "Tweed" is closed.

THE Czar is doing a Russian business in the new Government loan.

IT was not an editor who bought that beautiful six million dollar TWEED suit.

OUR Market reporter quotes potatoes a "shade slimmer," and justifies himself by saying that those he saw had their "jackets" off.

THE "cold spell" which has come upon us within the past few days, may prove to be a genuine "lock-up" to many fields of roots which indolence had left to the mercy of the elements.

THE Apiarians are still discussing the value of certain plants for bee pasturage and we think it time well spent, as there is yet much to be learned in regard to the honey producing properties of thousands of species as yet scarcely known to bee keepers.

ANOTHER shower of flesh is reported, but this time it fell in South Carolina. The flesh is said to resemble beef, and we would not be surprised if the hard times continue, that we should soon have showers of beef and mutton ready cooked for the table.

IT is now currently reported that the famous KEELY Motor is to be ready for exhibition at the great Paris show in 1878; and should anything occur to prevent it, one will certainly be ready for our Bi-Centennary exhibit in 1976. Encouraging, verily.

THE College which at present commands most attention is known as the "Electoral," and there are many anxious persons awaiting its decision. Both the "ins" and "outs" of office are just now on the "anxious seat," but we can scarcely decide which deserves most pity, for a man who seeks office is a pitiable object at best.

WE have just learned that our old Editorial friend, E. H. TRAFTON, is at Dansville, N. Y. He is preparing a lecture on "Newspapers and Newspaper-men." His extended knowledge of journalists and journalism will be an assurance of an interesting discourse. Therefore, if any "Lecture Committees are out *gunning* after talent," they can address him as above.

FORTY-THREE acres of farm land under the highest state of cultivation, with new buildings and outhouses, are offered for sale by Mr. T. R. PROCTOR of Bagg's Hotel, Utica, N. Y. Unusual advantages are offered to the purchaser of this farm, who can contract to supply Bagg's Hotel with necessaries. All who are looking for a cheap farm would do well to address Mr. PROCTOR.

THE crop of Bronze Medals this year has been the largest ever known in this country; besides, they are of good size and color. Just how many bushels have been produced is beyond our knowledge, but it is safe to say that there will be enough on hand to supply every child born in the next hundred years with at least one, as a souvenir of the great Centennial show.

WE are in receipt of N. W. AYRE & SONS' new Advertiser's Guide. It is in the shape of a monthly, and the subscription price is 50c. per year, postpaid. We have seen no journal designed to be of service to the advertiser that embraces as many excellent and novel qualities as the one under notice. We congratulate this enterprising firm, and feel sure that once seen the Guide will be a constant and trustworthy companion among those whom it is designed to benefit. AYER & SON, by the way, have recently removed to spacious and elegant quarters in the new Times building, Chestnut street, Philadelphia.

DEATH OF CHARLES D. BRAGDON.

MR. CHARLES D. BRAGDON, for many years editorially connected with the RURAL NEW-YORKER, and long known and esteemed as one of the ablest Agricultural Journalists in the country, departed this life on Thanksgiving Day (Nov. 30, 1876,) at Port Ontario, Oswego County, N. Y., in the forty-seventh year of his age. Though not perhaps unexpected to many—for the deceased had been an invalid for years—this announcement will be read with painful regret by thousands of our readers, as Mr. B. was widely known and highly regarded for his rare ability and excellent qualities of head and heart. Indeed, he was one who justly had a myriad of friends, and few, if any, enemies—for he possessed those noble and attractive characteristics which ever win and retain admiration and esteem, as all who knew him personally can attest.

Mr. BRAGDON was a native of the town in which he died, though he resided there but a short time after reaching his majority. His father was, and still is, one of the leading farmers of the region, and his son, in addition to receiving the best education afforded by the common schools and academies of the locality, was thoroughly trained in the various branches of the noblest and most useful of all avocations—Agriculture. This enabled the deceased to "act well his part," subsequently, as an Agricultural Editor, both in this State and the West, for he always knew (from either experience or observation, and frequently from both) whereof he affirmed on any subject pertaining to rural life which he discussed. His peculiar fitness for the work—the result of a rare combination of practical knowledge, mental ability, application and industry—was the great secret of his success, although manly independence, unselfishness, and unswerving integrity of character and purpose, were important adjuncts. These traits admirably qualified Mr. BRAGDON for the important and responsible position of an Agricultural Journalist, for he knew the Right, and neither friendship, influence nor money could induce him to commit or sanction Wrong; consequently he fearlessly exposed many deceptions and humbugs designed to fleece unwary ruralists and the public generally, thereby saving those interested from great losses. For this alone he is entitled to the grateful remembrance of the Agricultural and general public, whose welfare he ever sought to promote. In truth, he helped make the fortunes of the Industrial and Producing Classes, and hence was a public benefactor—really entitling him to a monument and his family to substantial recognition.

This is strong language, but true. The writer knew the deceased well and intimately for years, and can therefore attest to his fidelity to the cause of Rural Progress and Improvement, in the advocacy of which his ability was coupled with rare modesty and unselfishness. Had he been forward and ambitious he could have achieved fame and fortune in almost any field or profession chosen. But he was neither ambitious nor selfish. This is manifested in one of the last letters he wrote us—only a few weeks before his death—from which we quote these noteworthy and noble sentences, the italics being his own:—"One thing—*I never did envy any man in the profession*, no matter whether more or less successful in my line of business; hence I really rejoice with those who do rejoice over success, and sincerely mourn with those who have cause to mourn because of failure. I have no disappointments to mourn over or think of, for I never have had any ambitious objects, *in my own individual interest alone*, to promote."

Mr. BRAGDON'S life work, which he performed well, was Agricultural Journalism. His first article was written for the RURAL NEW-YORKER while a young man on his father's farm. It attracted our special attention, was published promptly, and the writer properly recognized. This, as Mr. B. assured us afterward, was the turning point in his life, and the cause of his becoming a journalist. After contributing to the RURAL for some time Mr. B. removed to Chicago and connected himself with the Prairie Farmer, the oldest and leading journal of its class in the West, of which he was subsequently the chief editor. In Jan., 1864, he become Associate Editor of the RURAL NEW-YORKER, which position he filled most creditably until the spring of 1865. A year or two later (after managing his father's farm one season) Mr. B. again went West and held a responsible editorial position on the Chicago Republican (now Inter-Ocean), and was for some two years the Western Corresponding Editor of this Journal. Meantime Mr. B.'s ability and versatility of talent became well known and appreciated. On the removal of the RURAL NEW-YORKER to this city, in Jan., 1869, Mr. BRAGDON again became our trusted and efficient Associate, and donned the harness of "Working Editor," as he was wont to style himself. And most assiduously, faithfully and effectively did he serve the RURAL, and the Ruralists of the Country, until failing health constrained him to retire in April, 1875, from a sphere of labor and usefulness in which he delighted.

On retiring from the RURAL Mr. BRAGDON sought relief and recovery by rest and a change of climate; but his insiduous disease—consumption—was too deeply seated to be conquered. He spent last winter in Florida, but with so little benefit that, on returning, he resolved to spend the remainder of his days at home, surrounded by family and friends. On this subject he wrote us most feelingly only last month, speaking eloquently of the blessings he possessed in wife and daughter—his only child, now just budding into womanhood—and adding that the chief reason why he desired to get well was that he might demonstrate his gratitude for and appreciation of their unselfish devotion. And yet he was cheerful and resigned, calmly awaiting the inevitable result. This was often manifested in his letters, in one of the latest of which he wrote us: "About self. Four weeks now since I left my bed for a longer time than long enough to have it made up or changed. Flesh, strength and breath going—going. But I am very comfortable in my dying, and am really enjoying life with all the present pull-backs. I lie here, read the N. Y. dailies and other papers and books, and watch the world with much the same interest that I did when I was of it and in it. I am *in no wise discontent*, and continue to do as I have done—take

CHARLES D. BRAGDON.

things as they come and be thankful for whatever of good I get out of them."

Of our friend's last few days we have no particulars at this time of writing—only a telegram announcing his depature from earth on Thanksgiving Day—but we trust and have reason to believe that his end was peaceful. His was a noble and generous nature, and he acted well his part in all the relations of life. He was an ardent, true friend, and benevolent to a fault, his kindness of heart and nobleness of soul leading him to forget self and make sacrifices for those who were needy or in distress. And yet he was a strong hater of wrong and wrong-doing, which he always exposed and condemned without mercy. Such a man will be missed and mourned sincerely, even amid the busy scenes of this telegraphic age, for he possessed the love, regard and confidence of relatives, friends and acquaintances everywhere.

The accompanying portrait of Mr. BRAGDON, engraved from a photograph taken only a few months ago, is an excellent likeness. It indicates the intellectual endowment and heart-kindliness of a noble and worthy character, to whose memory this hastily-written and necessarily crude tribute fails to do justice.—D. D. T. M.

The Story-Teller.

A MAN WHO LOST HIS NAME.

[Continued from page 366.]

VI.

THREE years had passed by, and still the situation was unchanged. Halfdan still taught music and told fairy stories to the children. He had a good many more pupils now than three years ago, although he had made no effort to solicit patronage, and had never tried to advertise his talent by what he regarded as vulgar and inartistic display. But Mrs. Van Kirk, who had by this time discovered his disinclination to assert himself, had been only the more active; had "talked him up" among her aristocratic friends; had given musical soirees, at which she had coaxed him to play the principal *role*, and had in various other ways exerted herself in his behalf. It was getting to be quite fashionable to admire his quiet, unostentatious style of playing, which was so far removed from the noisy bravado and clap-trap then commonly in vogue. Even professional musicians began to indorse him and some, who had discovered that "there was money in him," made him tempting offers for a public engagement. But with characteristic modesty, he distrusted their verdict; his sensitive nature shrank from anything which had the appearance of self-assertion or display.

But Edith—ah, if it had not been for Edith, he might have found courage to enter at the door of fortune, which was now opened ajar. That fame, if he should gain it, would bring him any nearer to her, was a thought that was alien to so unworldly a temperament as his. And any action that had no bearing upon his relation to her, left him cold—seemed unworthy of the effort. If she had asked him to play in public; if she had required of him to go to the North Pole, or to cut his own throat, I verily believe he would have done it. And at last Edith did ask him to play. She and Olson had plotted together and from the very friendliest motives agreed to play into each other's hands.

"If you only *would* consent to play," said she, in her own persuasive way, one day as they had finished their lesson, "we should all be so happy. Only think how proud we should be of your success, for you know there is nothing you can't do in the way of music if you really want to."

"Do you really think so?" exclaimed he, while his eyes suddenly grew large and luminous.

"Indeed I do," said Edith, emphatically.

"And if—if I played well," faltered he, "would it really please you?"

"Of course it would," cried Edith, laughing; "how can you ask such a foolish question?"

"Because I hardly dared to believe it."

"Now listen to me," continued the girl, leaning forward in her chair and beaming all over with kindly officiousness; "now for once you must be rational and do just what I tell you. I shall never like you again if you oppose me in this, for I have set my heart upon it; you must promise beforehand that you will be good and not make any objection. Do you hear?"

When Edith assumed this tone toward him, she might well have made him promise to perform miracles. She was too intent upon her benevolent scheme to heed the possible inferences which he might draw from her sudden display of interest.

"Then you promise?" repeated she eagerly, as he hesitated to answer.

"Yes, I promise."

"Now, you must not be surprised; but mamma and I have made arrangements with Mr. S—— that you are to appear under his auspices at a concert which is to be given a week from to-night. All our friends are going, and we shall take up all the front seats, and I have already told my gentlemen friends to scatter through the audience, and if they care anything for my favor, they will have to applaud vigorously."

Halfdan reddened up to his temples and began to twist his watch-chain nervously.

"You must have small confidence in my ability," he murmured, "since you resort to precautions like these."

"But, my dear Mr. Birch," cried Edith, who was quick to discover that she made a mistake, "it is not kind in you to mistrust me in that way. If a New York audience were as highly cultivated in music as you are, I admit that my precautions would be superfluous. But the papers, you know, will take their tone from the audience, and therefore we must make use of a little innocent artifice to make sure of it. Everything depends upon the success of your first public appearance, and if your friends can in this way help you to establish the reputation which is nothing but your right, I am sure you ought not to bind their hands by your foolish sensitiveness. You don't know the American way of doing things as well as I do, and therefore you must stand by your promise, and leave everything to me."

It was impossible not to believe that anything Edith chose to do was above reproach. She looked so bewitching in her excited eagerness for his welfare that it would have been inhuman to oppose her. So he meekly succumbed, and began to discuss with her the programme for the concert.

The evening of the concert came at last and, as the papers stated the next morning, "the large hall was crowded to its utmost capacity with a select and highly appreciative audience." Edith must have played her part of the performance skillfully for, as he walked out upon the stage, he was welcomed with an enthusiastic burst of applause, as if he had been a world-renowned artist. At Edith's suggestion, her two favorite *nocturnes* had been placed first upon the programme; then followed one of those ballads of Chopin, whose rhythmic din and rush sweep onward, beleaguering the ear like eager, melodious hosts, charging in thickening ranks and columns, beating impetuous retreats, and again uniting with one grand emotion the wide-spreading army of sound for the final victory. Besides these, there was one of Liszt's "Rhapsodies Hongroises," an impromptu by Schubert and several orchestral pieces; but the greater part of the programme was devoted to Chopin, because Halfdan, with his great, hopeless passion laboring in his breast, felt that he could interpret Chopin better than he could any other composer. He carried his audience by storm. As he retired to the dressing-room, after having finished the last piece, his friends, among whom Edith and Mrs. Van Kirk were the most conspicuous, thronged about him, showering their praises and congratulations upon him. They insisted with much friendly urging upon taking him home in their carriage; Clara kissed him, Mrs. Van Kirk introduced him to her lady acquaintances as "our friend, Mr. Birch," and Edith held his hand so long in hers that he came near losing his presence of mind and telling her then and there that he loved her. As his eyes rested on her, they became suddenly suffused with tears and a vast, bewildering happiness vibrated through his frame. At last he tore himself away and wandered aimlessly through the long, lonely streets. Why could he not tell Edith that he loved her? Was there any disgrace in loving? This heavenly passion which so suddenly had transfixed his being, and year by year deadened the substance of his old self, creating in its stead something new and wild and strange which he never could know, but still held indefinitely dear—had it been sent to him merely as a scourge to test his capacity for suffering?

The night was clear and still. A clock struck eleven in some church tower near by. The Van Kirk mansion rose tall and stately in the moonlight, flinging a dense mass of shadow across the street. Up in the third story he saw two windows lighted; the curtains were drawn, but the blinds were not closed. All the rest of the house was dark. He raised his voice and sang a Swedish serenade which seemed in perfect concord with his own mood. His clear tenor rose through the silence of the night and a feeble echo flung it back from the mansion opposite:

> "Star, sweet star, that brightly beamest,
> Glittering on the skies nocturnal,
> Hide thine eye no more from me,
> Hide thine eye no more from me!"

The curtain was drawn aside, the window cautiously raised, and the outline of Edith's beautiful head appeared dark and distinct against the light within. She instantly recognized him.

"You must go away, Mr. Birch," came her voice in an anxious whisper out of the shadow. "Pray go away. You will wake up the people."

Her words were audible enough, but they failed to convey any meaning to his excited mind. Once more his voice floated upward to her opened window:

> "And I yearn to reach thy dwelling,
> Yearn to rise from earth's fierce turmoil;
> Sweetest star upward to thee,
> Yearn to rise, bright star to thee."

"Dear Mr. Birch," she whispered once more in tones of distress, "pray *do* go away. Or perhaps," she interrupted herself, "——wait one moment and I will come down."

Presently the front door was noiselessly opened and Edith's tall, lithe form, dressed in a white flowing dress and with her blonde hair rolling loosely over her shoulders, appeared for an instant and then again vanished. With one leap Halfdan sprang up the stairs and pushed through the half-opened door. Edith closed the door behind him; then, with rapid steps led the way to the back parlor where the moon broke feebly through the bars of the closed shutters.

"Now, Mr. Birch," she said, seating herself upon a lounge, "you may explain to me what this unaccountable behavior of yours means. I should hardly think I have deserved to be treated in this way by you."

Halfdan was utterly bewildered; a nervous fit of trembling ran through him and he endeavored in vain to speak. He had been prepared for passionate reproaches, but this calm severity chilled him through and he could only gasp and tremble, but could utter no word in his defense.

"I suppose you are aware," continued Edith in the same imperturbable manner, "that if I had not interrupted you, the policeman would have heard you and you would have been arrested for street disturbance. Then to-morrow we should have seen it in all the newspapers, and I should have been the laughing-stock of the whole town."

No; surely he had never thought of it in that light. The idea struck him as entirely new. There was a long pause. A cock crowed with a drowsy remoteness in some neighboring yard, and the little clock on the mantel-piece ticked on patiently in the moonlit dusk.

"If you have nothing to say," resumed Edith, while the stern indifference in her voice perceptibly relaxed, "then I will bid you good-night."

She arose and, with a grand sweep of her drapery, moved toward the door.

"Miss Edith," cried he, stretching his hands despairingly after her, "you must not leave me."

She paused, tossed her hair back with her hands and gazed at him over her shoulder. He threw himself on his knees, seized the hem of her dress and pressed it to his lips. It was a gesture of such inexpressible humility that even a stone would have relented.

"Do not be foolish, Mr. Birch," she said, trying to pull her dress away from him. "Get up, and if you have anything rational to say to me, I will stay and listen,"

"Yes, yes," he whispered hoarsely, "I shall be rational. Only do not leave me."

She again sank down wearily upon the lounge and looked at him in expectant silence.

"Miss Edith," pleaded he in the same hoarse, passionate undertone, "have pity on me and do not despise me. I love you. Oh—if you would but allow me to die for you, I should be the happiest of men."

Again he shuddered and stood long gazing at her with a mute, pitiful appeal. A tear stole into Edith's eye and trickled down over her cheek.

"Ah, Mr. Birch," she murmured, while a sigh shook her bosom, "I am sorry—very sorry that this misfortune has happened to you. You have deserved a better fate than to love me—to love a woman who can never give you anything in return for what you give her."

"Never?" he repeated, mournfully, "never?"

"No, never! You have been a good friend to me, and as such I value you highly, and I had hoped that you would always remain so. But I see that it cannot be. It will perhaps be best for you henceforth not to see me, at least not until—pardon the expression—you have outlived this generous folly. And now, you know, you will need me no more. You have made a splendid reputation, and if you choose to avail yourself of it, your fortune is already made. I shall always rejoice to hear of your success, and—and if you should ever need a *friend*, you must come to no one but me. I know that these are feeble words, Mr. Birch, and if they seem cold to you, you must pardon me. I can say nothing more."

They were indeed feeble words, although most cordially spoken. He tried to weigh them, to measure their meaning, but his mind was as if benumbed and utterly incapable of thought. He walked across the floor, perhaps only to do something, not feeling where he trod, but still with an absurd sensation that he was taking immoderately long steps. Then he stopped abruptly, wrung his hands, and gazed at Edith. And suddenly, like a flash in a vacuum, the thought shot through his brain that he had seen this very scene somewhere—in a dream, in a remote childhood, in a previous existence, he did not know when or where. It seemed strangely familiar, and in the next instant strangely meaningless and unreal. The walls, the floor—everything—began to move, to whirl about him; he struck his hands against his forehead and sank down into a damask-covered easy-chair. With a faint cry of alarm, Edith sprang up, seized a bottle of cologne which happened to be within reach and knelt down at his side. She put her arm around his neck and raised his head.

"Mr. Birch, dear Mr. Birch," she cried, in a frightened whisper, "for God's sake, come to yourself! O God, what have I done?"

She blew the eau-de-cologne into his face and, as he languidly opened his eyes, he felt the touch of her warm hand upon his cheek and his forehead.

"Thank heaven! he is better," she murmured, still continuing to bathe his temples. "How do you feel now, Mr. Birch?" she added, in a tone of anxious inquiry.

"Thank you; it was an unpardonable weakness," he muttered, without changing his attitude. "Do not trouble yourself about me. I shall soon be well."

It was so sweet to be conscious of her gentle ministry, that it required a great effort, an effort of conscience, to rouse him once more, as his strength returned.

"Had you not better stay?" she asked, as he rose to put on his overcoat. "I will call one of the servants and have him show you a room. We will say to-morrow morning that you were taken ill and nobody will wonder."

"No, no," he responded, energetically. "I am perfectly strong now." But he still had to lean on a chair and his face was deathly pale.

"Farewell, Miss Edith," he said; and a tender sadness trembled in his voice. "Farewell. We shall——probably——never meet again."

"Do not speak so," she answered, seizing his hand. "You will try to forget this and you will still be great and happy. And when fortune shall again smile upon you, and—and—you will be content to be my friend, then we shall see each other as before."

"No, no," he broke forth with a sudden hoarseness. "It will never be."

He walked toward the door with the motions of one who feels death in his limbs; then stopped once more and his eyes lingered with inexpressible sadness on the wonderful, beloved form which stood dimly outlined before him in the twilight. Then Edith's measure of misery, too, seemed full. With the divine heedlessness which belongs to her sex, she rushed up toward him and remembering only that he was weak and unhappy and that he suffered for her sake, she took his face between her hands and kissed him. He was too generous a man to misinterpret the act; so he whispered but once more, "Farewell," and hastened away.—(To be continued.

WHAT I KNOW ABOUT FARMING.

November.—The beautiful, frolicsome grasshoppers have now crawled into their holes for winter. No more will we hear them singing on the fences or in the verdant trees. Not much any more. The bullfrog's melodious voice is hushed and the mud turtle dove has hid herself in the depths of the green waters.

Work on the farm now will not be so heavy as some other months. Still, you can put in time shelling your hay and buckwheat cakes and properly storing 'em away in the loft.

Now fatten your vegetables and store your poultry away in a warm, dry cellar, free from frost.

Early Rose potatoes, crossed with Hartford Prolific, fatten best and make the most savory pie.

December.—This is the month of fun and biled cider, and Christmas and mince pies and corn shuckings and sich. A McCormick reaper is a nice thing to shuck corn with. I have frequently started for home with my reaper on my back, went out to the crib and shucked several hundred bushels before breakfast.

Look out for some snow this month. Potato bugs won't trouble your vines after the snow falls on 'em. The bugs don't like snow. This is snow joke.

Now kill your smoked hams and side meat and butcher your dried beef.

Christmas was discovered a great many years ago by a chap named Judas.

The hop market will be lively this month.

Now set out your winter wheat; mulch well, but do not prune too clipsely.

Poets have called this month "gloomy, cold December;" but, then, that depends altogether on the weather, you know.

January.—Now look for a "corner" in ice, especially if your boots haven't got nails in 'em.

At the front end of this month a new year comes in. So the almanac says.

Just where it comes in nobody seems to know.

Darn'd if I haven't set up whole nights trying to see where the old year left off.

It's very easy to see where I left off my old boots, as I gaze with fond emotion on my new French calf box-toed ones; but this New Year business gits me rather badly.

About this time newspaper offices look out for "Odes to the dying year." They are generally owed for, too.

Fix up your fishing lines and air your woollens and furs.

Dig your winter apples and mow your cabbage.

The Golden Sebright Bantam is, perhaps, the best cabbage grown, though some prefer the Chester White, as they don't eat near so much as other kinds and keep fatter on less feed.

Hoe your squashes and examine your strawberry beds for grub worms. A grub hoe is the best thing to do it with.

Gather your radishes and drain the water off your swamp land. If you haven't any swamp land to drain, drain the cider barrel or something else. A farm isn't worth a sou markee unless there is a drain on it.

And the rosy (nosy) month of January is just the time to do this work in.

The above is copyrighted.—*Solon Shingle.*

MAXIMS OF ROCHEFOUCAULD.

Very few people know how to grow old.

He who lives without folly is not so wise as he thinks.

Nobody is ever so happy or so unhappy as he imagines.

It requires greater virtue to sustain good fortune than bad.

There is no man clever enough to know all the evil which he does.

Our passions are the only orators who are certain to persuade us.

The more one loves one's mistress, the nearer one is to hating her.

The Literary World.

RECENT LITERATURE.

Books for Holliday Presents.

Living Too Fast. By William T. Adams ("Oliver Optic"). Boston: Lee & Shepard. New York: Charles T. Dillingham.

The miseries of living beyond one's means are depicted in this story in such a way as to make them shunned by every honest man or woman. The history of a young man who obtains a position as paying teller in a large city bank, marries a frivolous, extravagant wife, runs in debt, helps himself out with the bank-funds intrusted to him, speculates to retrieve his fortunes, loses more money, and finally flees to Europe an exile, a defaulter and a criminal, is worked into a story of continued interest. Like a majority of criminals, he was not all bad, but had many good qualities. Unfortunately for the probability of the affair, however, a rich old aunt dies on the very day he absconds and, without his knowledge, he becomes a wealthy man. His defalcation is made good from his own funds, he is saved from public disgrace, his wife subsequently turns out to have been an undeveloped angel, and everything comes right in the end. The author apologizes for this, by saying that the hero's "career ought to have ended in the State Prison; but his (the author's) work is a story."

Nelly Kennard's Kingdom. By Amanda M. Douglas. Boston: Lee & Shepard.

It is true that step-mothers are, in many instances, largely responsible for neglect of children of their husbands. It is also true that the natural appeal made by an orphaned child directly to the heart of a good woman is never unheeded. In this case the heroine marries into the family where she encounters not only two strange children but a mother-in-law and a sister of the dead wife as integral parts of her new family. Her trials and tribulations from all sources are both numerous and hard; but her angelic nature overcomes all obstacles to the eventual enjoyment of the love and respect of her new unfriendly relatives in all instances except one. This is in the case of Aunt Adelaide, the deceased wife's sister, who finally, is well punished by an ill-assorted marriage with an adventurer. Though simple in its details and devoid of any pretence to plot, the story is withal so sweetly told that the interest of the reader is maintained to the end. It is one of those books which leaves nothing but good impressions upon the mind.

Oh! Why Should the Spirit of Mortal be Proud? By William Knox. Boston: Lee & Shepard. New York: Charles T. Dillingham.

The somber poem of William Knox was never before so beautifully dressed. Between the tasteful covers are leaves of satin tinted paper, upon one side only of each of which is a stanza of the poem and an exquisite wood cut, engraved by John Andrew & Son after designs by Miss L. B. Humphrey. The elegant workmanship and artistic skill displayed at every stage of its preparation, does credit to all whose taste and labor were employed in its production. It will be an acceptable holiday present to any person of refinement and a source of much future enjoyment.

COMING EVENTS.

The publishers of The Atlantic Monthly have issued their annual prospectus. The magazine is now entering on its twentieth year, and while some of the writers who gave luster to its earlier pages have passed away or ceased to write, it still counts among its contributors four of the greatest names in American literature, which have been identified with it from the first volume. Longfellow, Whittier, Holmes and Lowell will all contribute during the next year, Mr. Longfellow promising an unusual number of poems. E. C. Stedman, T. B. Aldrich and other well-known Atlantic poets will also continue to write. Mr. Aldrich is to contribute a story in three parts, the name of which is not announced. Mr. Howells, whose farce, "The Parlor Car," made quite a hit, and is soon to appear on the boards of the Fifth Avenue Theater, will publish two stories in dramatic form, of three numbers each; and several dramatic fantasies and extravaganzas may be expected from the author of the "Queen of Hearts." Mr. Howells will also furnish some essays on New England Country Life. Mark Twain will be a frequent contributor during the year, and may now be considered one of the regular Atlantic staff. Charles Francis Adams, Jr., is to write a series of papers on Colonial History, and G. P. Lathrop, whose "Study of Hawthorne" has been so warmly commended, some essays on American authors. All readers of the magazine will be glad to learn that Mrs. Kemble's chapters of autobiographical "Gossip" are to run through the greater portion of the year, while they will await with interest the *denouement* of Henry James, Jr.'s serial, which will be concluded in an early number. Charles Hale, lately our Consul-General to Egypt, will contribute a few brief papers on Egyptian Life.

Following the plan of Mr. John Fiske's article on "A Librarian's Work," in a recent number, the Atlantic will now have a valuable series of papers on various professions and employments by competent writers, and these will afford glimpses of the Work of a School Superintendent, a New England Farmer, a Western Farmer, a Managing Editor, a Congressman, a Manufacturer, etc., etc.

The publishers announce two new and unique features for the coming year, that are likely to prove extremely popular. One of these will be contributions to each number of original music by such able composers as John K. Paine, George L. Osgood, Julius Eichberg, Dudley Buck and Francis Boott, with words by some of the most distinguished Atlantic poets. The other is a new department to be called "The Contributor's Club," which will be devoted to desultory criticism of art, letters, politics and society. Some of the best-known contributors of the magazine will appear constantly, though anonymously, in its columns, and the publishers say it will be unlike any feature in other magazines.

The publishers have prepared a life-size portrait of the poet Bryant, which can be obtained by subscribers to the Atlantic only, for the nominal sum of one dollar. The subscription price, without portrait, is $4; with it, $5.

BOOKS RECEIVED.

From A. S. Barnes & Co., New York:

The History of Liberty. A paper read before the New York Historical Society by John F. Aiken. (Cloth—pp. 163. Price $1.)

Sheldon & Co., New York:

A Point of Honor, by Mrs. Annie Edwards. (Cloth; 12mo.—pp. 325. Price $1.50.)

E. Steiger, New York:

Schedler's Map of Turkey and Greece.

T. B. Peterson & Brothers, Phila., Pa.:

Corinne, by De Stael. (Paper—pp. 170. Price 75 cts.)

Lee & Shepard, Boston:

The Reading Club—No. 4—by Geo. M. Baker. (Price 50 cts.) Snip and Whip, and some other Books, by Elizabeth A. Davis. (Illustrated. Cloth—pp. 174. Price $1.25.) Young America—Second Series; Vine and Olive, or Young America in Spain and Portugal, by W. T. Adams ("Oliver Optic"). (Cloth; 16 mo.—pp. 412. Price, $1.50.) The Young Trail Hunters, or The Wild Riders of the Plains, by S. W. Cozzens. (Illustrated. Cloth; 12 mo.—pp. 235. Price $1.50.)

Magazines for December:

American Naturalist, Lippincott's.

Sabbath Reading.

FORGIVENESS.

Like buds of spring,
Sweet words are borne from darkness and despair,
And waft new fragrance through the sunny air;
Glad spirits sing.

Ah! ye who fought,
And nobly fought as warriors fit to die,
Shall ye the power of brotherhood defy,
By death untaught?

The right and wrong
Are buried with the dust of those who sleep
In the warm stillness of earth's bosom deep,
And life is strong.

Forgive! Forgive!
Thus sings the sunlight as it gently glides
Into each burdened heart that doubt divides
Forgive and live!

Forgive! Forgive!
Oh! ye to whom the plying Heaven had deigned
Man's sovereign rights by tyrant power disdained,
Forgive and live!

O love divine!
Arise, arise, that souls may worship thee;
That souls may glorify thy name, and see
Their strength in thine!

Men, ye are kings!
But strife will make ye brutes, unfit to sway
The kingdom of the future, formed to-day
The least of things!

Eternal God!
Fill these great hearts with Thine eternity,
Let union strew with flowers of liberty
The aching sod!

UNBELIEF.

The following, from the pages of the Spectator, summarizes a strong address of Bishop Elliot, concerning unbelief in the old Bible:—The Bishop of Gloucester and Bristol has been delivering, this week, a series of thoughtful addresses on the prevalent unbelief of the day, in which he describes that unbelief as rather a vague and drifting tendency than a fixed state of mind; nay, the unbelievers, he says, have so completely succeeded in suspending their judgment that they hardly believe even in their own unbelief. He traces this condition of things chiefly to three causes—to the impression produced by the historical criticism of modern times, of the vast uncertainty attending all ancient history, and especially all history involving stories of miracles; to the advance of scientific notions which seem to dispense with the creative energy of God; and to the new intensity with which the enigmas of life, the moral and metaphysical difficulties involved in the origin of evil, are urged upon the imagination of all of us. * * * * For our own parts, while we accept what Bishop Elliott says of the unique character of the Old Testament history; while we cordially believe that its continuous and indelible realism in painting man, and his constant and deep belief in the providence of God afford a testimony at once to the honesty of the narratives and the deep foundation of Hebrew history in a genuine revelation, we cannot recognize any feature in it which should assure us against those great mistakes of detail which occur in all other history—especially as we do find here and there those remarkable inconsistencies between one part of the history and another which are characteristic of all human authorship, and especially of the authorship of an unpracticed and easily-believing age. It seems to us that historical criticism makes an unanswerable case against the habit of assigning anything like very high authority as to detail to such histories as the earlier narratives of the Old Testament, and that no one can reasonably believe in any very high authority for them except on some such ground as infallibility of the Church, whose canonical Scriptures they form. But as we cannot see any proof of such infallibility and, indeed, find in the Old Testament histories much which is quite inconsistent with it, we should say that, on the whole, the kind of hesitation which historical criticism has taught us in accepting the details of Old Testament history—especially the early history—is well justified.

Not the less we should maintain that the coherent belief of the prophets and historians in the divine purpose which formed Israel into a distinct people and molded it for a special function in the life of the world—a belief which shines through all the early traditions, the early records, and the early poems of the people as clearly as through its latest prophecies—is good and striking evidence that they were a people chosen by God to understand His character, and declare it to the rest of the earth; and that their national character had been formed—if not exactly by the experience described, yet by experience more or less closely resembling it in the confidence it had given them in the mighty hand and outstretched arm of Jehovah—for the very purpose for which it was ultimately used by the Divine power. It is quite one thing to say that all these curious old books, full of the evidence of human imperfection, not only in the subjects treated but in the persons who treated them, are to be implicitly trusted as accurate records, though they neither claim inspiration for themselves nor show any trace of completeness and exceptional accuracy, and quite another, and a very different thing indeed, to accept them heartily as the reflection of a true faith, extending through many ages, in the guiding hand of a God who was not only teaching the people whose history they embody the lesson of righteousness, but filling them with the expectation of a destiny which would, through their race, bring life and light and hope in a broad stream of regenerating power into the world.

Ladies' Portfolio.

RARITY.

In dreams I found a wondrous land,
Radiant with roses on each hand.

No grasses, trees, nor shrubs were there,
But roses blossoming everywhere.

Great velvet-petaled blooms were these;
Red millions trembled in each breeze.

They swept toward the horizon's verge
In many a splendid ample serge:

They spread on all sides one intense
Monotony of magnificence.

Then suddenly, where my pathway ran,
Loomed the vague presence of a man.

And in his clasp, with strange delight,
I saw one daisy, shimmering white.

Such daisies bloom in slender sprays
By throngs among dune's meadowed ways.

Yet all my soul, at this weird hour,
Leaned out to that one simple flower.

For chastity, delicately fair,
And better still, supremely rare,

It wore a pastoral charm so sweet,
This lovely lissom Marguerite,

That seeing it was like dear repose
To me, whose whole heart loathed a rose.

(Harper's Magazine.

THE HOUSE-PLANT MANIA.

One pleasant spring day, when our hearts were filled with the gladness of reviving Nature, with gratitude to the great Creator and a good deal elevated above the common and prosaic in general, Mrs. Smith and I called upon our new neighbor, Mrs. Jarvis.

"What a beautiful day!" remarked Mrs. Smith, who was favored with a previous acquaintance; "it is really cheering after the severe weather we have had."

"Have you seen my Fuchias?" replied Mrs. Jarvis, Yankee-like. "Every branch is loaded with buds, and I'm watching with the greatest anxiety for the first blossom."

"Did you attend the lecture last evening?" I asked.

"No, I did not; I hardly dare leave the house in the evening for fear the fire might get down, and there might be a change in the weather and my plants would get chilled; it turns cold so dreadful sudden this time o' year. Do look at that Geranium, Miss Germane! isn't it lovely?"

"Have you read Bryant's last poem?" asked Mrs. Smith.

"Dear me, no; my time's so taken up with my housework and the care of my plants that I don't get a chance to look at a book or paper from one week's end to another. Just see that Ivy, Mrs. Smith; isn't it growing splendidly?"

"You have so many plants, they must be a great care to you, with your poor health."

"O, dear! I guess they are. Why, I've got more'n a hundred different kinds, and I've lugged them about this winter until my back and sides ached so it *did* seem as though I couldn't stand it. They must have air an' sunshine, you know, an' I've just carried them from one window to another, an' every pleasant day, when it wasn't too cold, I've taken them out on the porch. You see we're living in the dining-room; it lay more to the south and was better for my plants than the sitting-room, an' we couldn't afford to keep up a fire, night an' day, in both, so we just moved in here. There isn't any bedroom off this room, an' Mr. Jarvis an' the children didn't like it much going to bed an' sleeping in the cold, but I told em' I guessed they could stand it if I could, an' I didn't mind it so long as I knew my plants were warm an' wouldn't freeze. I do believe my Calla Lily is going to bloom. It looks to me as though there's a bud starting. You just come, Mrs. Smith, an' see if you don't think that's a bud."

"You have children," I remarked.

"O yes, two; a boy and a girl. Let me see: Willie will be seven next October, an' Bessie's most five; they go to school every day, when there is school, an' I'm always sorry when it's out. They're *so* mischievous I have to watch them every minute they're in the house, or I do believe they'd destroy every plant I've got. They're not bad children, you know, but they're so full of play they turn everything upside down; an' then they ask so many questions, it's enough to bother the life out o' me. Isn't that Heliotrope doing finely? It's growing the best this spring it ever has. I *do* love it; it is *so* fragrant."

"Aren't your children rather young to attend school, and couldn't you find some way of amusing and instructing them at home?" I ventured to suggest.

O yes, I might if I only had the time; but I'm so busy. Why, I haven't scarcely been out of the house since we came here, not even to go to church. An' there was poor Mrs. Johnson, who died last week, an' who's been sick all winter; she used to be a schoolmate and dear friend of mine, an' Mr. Jarvis said I really ought to go an' see her, an' I did mean to. She used to send word to me that it would do her so much good to see me; but, poor woman, she died before I could find time to go. O, I'm *so* proud of my Hyacinths! aren't they beauties? I counted fifty blossoms on one stalk, this morning. They ought to do well, for I *do* believe I've spent as much as an hour every day, watching an' tending them."

So she rattled on about her Fuchsias, and Geraniums, and Vines, and Lilies, and Heliotrope, and Hyacinths, and this, and that, until, heartily wearied and disgusted, we took our leave as soon as there was a pause in her chatter; and the last words that sounded in our ears, as we went meditatively down the walk, with all the gladness and elevation taken out of us, were:

"Mrs. Smith, I'm goin' to send for some Tuberoses, next week; don't you want to send 'long an' get some, too?"

WINTER EVENING AMUSEMENTS.—No. 2.

"I think not," said Mrs. Smith, decisively. "I'm sick o' house plants," to herself.

So am I, in Mrs. Jarvis' house, and in every other house where they supersede husband, children, home comfort, and everything else in the heavens above or the earth beneath, even to the God who created them. Geraldine Germane.

THE STORY OF A RUSSIAN PRINCESS.

That truth is decidedly stranger than fiction, the subjoined narrative from a correspondent of the Courier-Journal fully attests:

What do you think of a Russian princess, a genuine article, with her name, coat of arms, etc., stamped even on her stockings, serving in the capacity of chambermaid at a gentleman's house, bringing up a fellow's—this fellow's—early cup of coffee and gracefully shuffling down stairs with his boots? How would that fit into your pipe for a quiet smoke? I will tell you a tale stranger than fiction. In the first place I must give incredulity a gentle tap on the head as a hint to be quiet by premising that Russian princesses in their native land are as thick as leaves in Vulambrosa. This particular princess, who had cut some caper or other, resulting in a policeman's order for her to move on, came to this country. She here fell in love with a thoroughbred scallawag and married him. He was an expeditious young man, and he went through her money and diamonds like beans through a tin horn. As the diamonds melted away they came down in life by going up to the neighborhood of the attic. At last, one morning after breakfast out of the melting of the last earring, the young man arose, embraced his wife, shed one tear on her throbbing bosom, and bolted. He went off with another name and took to keeping school at a salary of forty dollars a month. The princess took an engagement as chambermaid in a private family at $4 a week and no half benefit. Eighteen months rolled around, at the end of which time she treed her man—the vagrant husband. She went into court and demanded a share of the pedagogue's salary. The scallawag pulled out a decree of divorce obtained somewhere in the West. But the employer of the princess was a prominent lawyer, and badgered by his servant, took up her cause.

The decree was right, but had one fatal defect. Such a document is taken in evidence in the New York courts, provided it has the signature of the clerk of the court, seal, etc.; also that of the judge, with the additional requirement that the judge must certify that it is the clerk in question, and the clerk must swear to the judge, which is funny, and with all due respect to courts, I should say, highly preposterous. In this document the clerk had failed to certify to the identity of the court, and the justice here threw out the evidence and assigned to Mme. Princess $12 a week out of her husband's earnings. Now see the effect of sudden prosperity. From that moment the princess has refused to make a bed or flourish a duster, and as long as school keeps will not touch his books with a pair of tongs.

The dreams of love, to continue true, must not take too visible a form, nor enter into a too consecutive history; they must float in a misty distance; the soul in which they hover can no longer think of the laws of existence; it inhabits another world; it forgets itself in the ravishing emotion which troubles it, and sees its well-loved visions rise, mingle, come and go, as in summer we see the bees on a hillslope flutter in a haze of light, and circle round and round the flowers.—*Taine.*

A gentleman is a rarer thing than some of us think. Which of us can point out many such in his circle—men whose aims are generous; whose truth is constant and elevated; who can look the world honestly in the face, with an equal, manly sympathy for the great and the small? We all know a hundred whose coats are well made, and a score who have excellent manners, but of gentlemen, how many?

Reading for the Young.

SOMEBODY'S DARLING.

Warmly tuck'd in little bed,
Somebody's darling lay;
Golden curls around her head,
So tired after play!

Little cheeks like roses red,
Sweet laughing eyes of blue,
Smiling mouth—you might have said,
Bright angels round her flew.

Tiny hands are crumpled tight
Under her rosy cheeks,
Mother softly shades the light,
That through the window streaks.

Slowly treading up the aisle,
Somebody's darling moves,
With downcast eyes and happy smile,
And near her all she loves.

Sun-rays stream through painted glass,
A happy bride is she;
Around her stand her village class,
Somebody's darling to see.

Hush! O hush! tread softly now,
Angels are in the way,
White and still as untrodden snow,
Somebody's darling lay.

Weep not, weep not so for her,
To her can come no ill;
Surrounded by God's loving care,
And—Somebody's darling still.

READ, MARK, LEARN AND INWARDLY DIGEST.

Dear Editor:—I am moved by the spirit to have a little talk with the young letter writers of the Rural, if you are willing. I have read nearly all of their epistles, and am led to ask if they appreciate what an opportunity is given them, through the columns of your paper, of making themselves known and respected outside of their home-circle. Not so much in saying pert things, as by saying well what they do say; and talking more about *things*, instead of flinging at one another. These little by-plays upon words and names are well enough when not carried to the extreme. Let me call them *spice*; you will readily understand that "cake is not cake" when it is all spice, neither is it so palatable when there is too much spice in it, as when there is just enough; in other words, you want exactly enough to give flavor to your letters, and no more.

One great charm in writing is, to select such words and so use them as to make an agreeable impression. Let your letters be like "continued stories," in the sense that as soon as one is read another will be wished for. This does not necessarily incur your agreeing with every one, or with any one. But whether we agree or disagree, especially the latter, if we unhappily express ourselves we weaken our influence and thereby lose our power. In other words, nothing is gained by being disagreeable, while through agreeability a kindly spirit subtly pervades all hearts and makes us many friends. It is the little leaven that leaveneth the whole lump.

Endeavor, in every letter, to tell us of something new. A new piece of work, or a new way of doing an old one. These things attract us, and little by little we accumulate considerable knowledge in different channels, and so easily too, as well as skill and aptitude in performing various useful and ornamental work. Of course the girls will naturally take to needle, knitting and crochet work, while the boys will tend to telling us of what they have done, or are doing, with knife, hammer and saw.

It is wonderful how much and how well some boys will do with a common pocket knife. I have a pair of pincers that will open and close, rivet and all cut from one piece of wood, about four inches long and an inch or so thick. Many have admired them, because they are not only cut from one piece of wood, but are so well finished. The making of a pair of wooden pincers is not so much in itself, as the skill acquired in using the knife, the applying one's self to doing something, and the consciousness of your recreation being not alone harmless, but beneficial to you in years to come. My impression is that boys will find pattern makers of tools wonderfully skillful in the use of the knife.

I was very much pleased with samples of work shown me that had been done at the Kindergarten schools. They were pieces of thick white paper, through which were holes made with a pin, in the shape of dogs, horses, birds and flowers. Some, after being thus pricked, were worked in and out with worsted, making a complete outline of the figure. Several of these were beautifully wrought, the color being so nicely selected that they were really quite appropriate and pretty. One, however, a well-formed horse, was embroidered with scarlet, which did not harmonize quite as well with nature as the scarlet cherries and green leaves. It occurred to me that this work would look nicely on wall pockets, in frames, on cloth for cushions, tidies and covers. To put on cloth, pin-prick the form into common paper, cut out and use as a pattern for cutting the different colored cloths, then sew on a solid background. I saw a stand cover made of black cloth, upon which flowers and figures cut from prints were sewed, that was really artistic. The sewing was over and over, with thread the color of the figure, so as to show the stitches as little as possible.

In speaking of your pets, please do not merely name what they are and how many, but write the best description you possibly can of their size, color, age, disposition and pet name. It will enable us to see them, while the practice of thus writing is an admirable one for you. You have all probably heard of the Chinese carving. Let me tell you of an oval, light, yellow whitish wooden plate, called a "picture plate," that I have seen. The figures were raised, and seemed at first sight glued on, but examining them carefully I found the plate to be of one solid piece of wood. This plate was divided into sky, land and water; at the top of the plate in the sky, birds were flying, on the land were trees, houses and cattle, while in the water was a boat with a man in it. Such miniature specimens, and so well proportioned were they, that it was really a pleasing and unique ornament. Many would hardly suppose Master Chinaman so skillful, but it shows what can be done by them in that line. We may be equally skillful in certain things. What those things are I leave for the Cousins to tell.

Ithaca, N. Y. Vee.

LETTERS FROM BOYS AND GIRLS.

What He Did.

I send you ten names and twenty-five dollars, and select the Cabinet Magic Lantern for my premium. I tried hard for the Boys' Sporting Rifle, but everybody is hard up in these parts. Some of the boys' fathers, when I went to them, said that they guessed I would have to wait until next year before they could subscribe. But I stuck to it. I called upon them every day for a week with a new argument. I told one man that said he couldn't afford it, that he couldn't afford to do without it. One has not paid me yet, so I had to borrow $2.50 from my father to make up the amount to send the Rural. Another gave us a barrel of potatoes as the price of subscription.

Cousin Ben says he does not like my little game, published in Rural, Sept. 9. It comes too near swindling and cheating. "I should think," he says, "any boy would feel mean if he took five cents in this way." Well, now, Cousin Ben, you try the trick upon some of your rich relatives and if you succeed, just enjoy a good laugh and then—not to feel mean afterwards—hand the five cents back. You are not obliged to keep it, are you? Ben's father says it isn't right to take money without "giving a *quid pro quo*." The laugh is worth five cents, and if it isn't, make it *one* cent, or a button. Then how about Ben's father's *quid pro quo?* And you, Mr. Editor, say that Ben is right, and that money gained in dishonest or underhand ways is often a curse to its possessor. Well, following the learned example of Ben's father, let me tell you my father says, *Honi soit qui mal y pense*, which—to save my Cousins the trouble of looking into the dictionary—means, Evil to him who evil thinks.

I do not pride myself upon my learning, but upon my experience, and I believe that young boys who will be led to evil by such innocent jokes are bad anyhow, and that being over-strict with boys (and girls too) does more harm than good. This is the reason why ministers' children are usually such highflyers. The fact of it is, some people make a great splutter and talk about the wickedness of swallowing gnats, while on the sly they can take in a camel without a wink!

Belle says, Joe Steele is a cheeky little fellow. "Cheek" in a boy, if it's the right kind of "cheek," is what the right kind of modesty is in a girl, Cousin Belle. Boys and girls have different roads to travel in earning their living, and a boy without "cheek" and a girl without modesty ought to change places.

Sometimes I get snubbed pretty hard, but, like the fabled Phœnix, I rise again and am as "cheeky" as ever. Send my lantern at once.—Joe Steele.

[I'll do it. Why don't more of my nieces and nephews do the same.—Uncle True.]

His Weak Side.

Well, boys and girls, here I come again to make you another short visit. Perhaps you may think a Storm visit not always agreeable, but I hope mine will be, for I am not the kind of a storm you imagine. My signature is taken from a man-of-war of that name in the War of 1812, so don't think I have come among you to make a noise, for that is not my intention. I have no particular reason for calling myself after this venerable vessel; I have *tried* to show my colors, and if none of you like them, compel me to strike them. I am very much obliged to Belle E. F., for that last

letter of hers, not that I think she wrote because I asked her to, but because it gives me satisfaction to read such letters as she always writes. Of course I would be foolish to take offense from her telling of my conceit, for, in reading my letter in the RURAL, I could not help seeing that in my effort to make it lively, and kick up a spree, I had shown more of my weak side than I intended, but I don't mean to take anything back. B. E. F. says she and I will be friends, she hopes. Of course we will; so give me your hand. BELLE E. F., and you and I will be independent partners. Speaking of ADELE W., I think her pretty good at criticising others, without giving them very much chance at her. I think her weak side leans in the same direction mine does. YOUNG EDITOR No. 2 is not very popular, so far, but I hope he will do better next time. B. E. F., strike out again soon. I guess this letter flavors pretty strongly of my weak side, but it is written, so it will have to go. —STORM.

Here He is Again.

HURRAH! Just as I expected; scoldings and good words from both sides. I had better, in the first place, try to "lay out" those who seek to find fault. Oh! ah, BELLE E. F., and so you did not like the few words I said in favor of YOUNG ARTIST? I expect those black eyes of yours flashed fire, and your tall form shook with rage when you first read my letter. Excuse me, but your letter was not in print at the time I wrote, or I would undoubtedly have had to confer those few words upon you of which you seem to be envious. I also think you can hold *your* own quite nicely with CERIC, for he "is a perfect gentleman, and ought to win the admiration of all the ladies;" of course he has won your admiration long ago, YOUNG PRINTER comes out in a very lame argument in comparing calico with type. Let me ask you if you ever make a quilt out of the same material more than *once*? I think not; but the same lot of type may be used or changed hundreds of times, presenting something new every time, and still be good to use. About the girls preaching decorum: of course they are best to give advice or reproof, not in the *grave* sense of the word, but I mean in the *jolly* sense; what is the harm in occasionally hiding their ball of thread? or slipping their comb? and if they remonstrate against such proceedings to playfully make a noise? I for one cannot see the harm in that; I do not think we should always go around with grave faces; I think there is a time to be jolly as well as grave. WALTER P. wants me to send a puzzle; perhaps I will some future time. MAY BELLE E. says that all the girls disagree with me; very well, if the girls do not like my letters it is all right—that is what makes it lively. STORM and YOUNG EDITOR No. 2 seem to be wide-awake boys. I hope to see more of your spicy letters. Good-by for this time (for I intend to come again).—YOUNG EDITOR.

A Young Hunter.

DEAR RURAL:—I am a little boy only six years old, and cannot write, but mamma said she would write a letter to the RURAL for me if I would tell her just what to write. I went to school last summer and got most through my Primmer. I have got a little sister, three years old; her name is MAMIE. Also a hound dog named Prince. These are all the pets I have, except chickens. My papa took a pair to the Poultry Show and got the premium. Papa has killed thirty-five squirrels this fall. I have been hunting with him two or three times, and helped him tree them so he could shoot. HERBIE H. C., *Caroline Center, N. Y.*

The Puzzler.

CROSS-WORD ENIGMA.

PUBLISHER'S NOTICES.

TO THE LADY READERS OF THE RURAL.

SPECIAL OFFER OF RARE PLANTS AND SEEDS

HAVING a few choice plants now growing in the RURAL'S EXPERIMENTAL GROUNDS, which we think would be desirable to some of the lady readers of the RURAL NEW-YORKER, we make the following offer:

Those who, in renewing their own subscription, send us an additional name (not already on our list) with the sum of $4.90 for the two, may select any two of the following-named plants and a paper of the seed of the Molucca Balm. Those who receive these premiums can divide with their friends, or keep them all, as they may agree among themselves, as our object in making the offer is to induce old subscribers to send us new ones, thereby increasing our list. The plants and seeds offered are very choice, as will be seen in description given below. The plants will be sent by mail free, and carefully packed and forwarded immediately on receipt of subscriptions.

Abutilon Boule de Neige.—The best of the *Abutilons*. Its flowers are large and white. It blooms throughout the whole year and therefore is alike desirable for the conservatory or garden. Its growth is rapid—small plants attaining the hight of five feet during the summer months. In the fall it may be cut back to any desirable size and potted for the winter, when it will quickly recover its symmetry and resume its ever-blooming habit. Its quick and exceeding popularity is a sufficient guarantee of its merits.

Marie Lemoine.—Among a hundred or more varieties of double-flowered *Pelargoniums*, new and old, this is as yet unrivaled. The individual flower, of a delicate rose color, as well as the truss, are the largest of their class. It is difficult to select a more attractive plant than Marie Lemoine when freely blooming. Every truss is in itself a bouquet. The leaves are large, zoneless, vigorous. The plant is compact and, like *Abutilon Boule de Neige*, is invaluable, either for the conservatory, window or garden.

Hydrangea paniculata grandiflora.—So much has been said of this new Japanese shrub during the past year that little need be added now. It has stood 26° below zero unharmed. It begins blooming in early August, continuing until after hard frosts. The thyrses of flowers, first greenish-white, then white, then rose, often measure a foot in length and twenty inches in circumference. Every stem being thus terminated, the striking appearance of an entire plant may be conceived. There can be no doubt that this is one of the most valuable of all perfectly hardy shrubs.

Variegated Ampelopsis or *Vitis heterophylla variegata*.—We do not hesitate to pronounce this one of the most attractive vines in cultivation. The leaves are deeply-lobed and variegated with white and green, much as *Abutilon Thomsoni* is variegated with green and yellow. From its racemes of flowers are formed fruit as large as currants, each one of which is a different color in shades of claret, azure-blue and green. These berries, which are first as soft as a currant, become finally as hard as bullets.

The pretty stems are also variegated, green, whitish and rose. The roots are perfectly hardy, and the vine's growth so rapid that it will cover twenty-five feet square in a season. For conservatory walls or pillars, for trellises or rockeries, it cannot fail to please. It has been growing in the RURAL EXPERIMENTAL GROUNDS for several years without the least protection.

Jerusalem Artichoke.—Believing that the Jerusalem artichokes are exceedingly valuable as food for nearly all kinds of farm stock, we place them among our valuable premium plants. They will yield more bushels of tubers per acre than the common potato and we believe them more valuable for feeding purposes, besides the artichoke will grow vigorously where the potato would fail entirely. We will send one-half pound of each of the Long Purple, and Round White, for each new subscriber as above, or one pound of the tubers of either variety. We shall store a quantity of the tubers in the cellar for sending out this winter; but those of our subscribers who reside north of the latitude of New York City, had better leave their plant premiums in our hands after the first of January until early spring. We will, however, "book" all orders received during the winter, to be sent at the earliest possible moment.

Achania malvaviscus or Malvaviscus arboreus.—The flowers are bright red of a turban shape two inches long. It blooms incessantly whether indoors or out. In the conservatory it may be trained so as to cover wood-work as readily as a vine. Its growth is so rapid that small plants set out in the spring will cover a space four feet in diameter by fall. As a plant for the sitting-room, the little care it needs, its perpetual scarlet flowers, contrasting elegantly with its golden-green, plush-like leaves—its endurance of dry heat and dust render it most pleasing and satisfactory. We commend this plant with confidence.

Moluccella laevis.—We will send, also, to ALL who are entitled to a choice of any two of the above plants, a package of the seeds of the singular Shell Flower, an account of which and an engraving were given in the RURAL of Aug. 17, p. 117.

TERMS FOR 1877, IN ADVANCE,

INCLUDING POSTAGE, WHICH PUBLISHERS PREPAY.

Single Copy, $2.50 per Year. To Clubs:—Five Copies, and one copy free to Agent or getter up of Club, for $11.25. Seven Copies, and one free, for $16.05; Ten Copies, and one free, $20—only $2 per copy. The above rates *include postage* (under the new law) to any part of the United States, and the American postage on all copies mailed to Canada. On papers mailed to Europe, by steamer, the postage will be 25 cents extra for each subscription. Drafts, Post-Office Money Orders and Registered Letters may be mailed at our risk. ☞ Liberal Premiums to all Club Agents who do not take free copies. Specimen Numbers, Show-Bills, &c., sent free.

News of the Week.

HOME NEWS PARAGRAPHS.

THE agricultural works at Council Bluffs, Iowa, were burned Dec. 1. Loss, $35,000; insurance, $13,000.

Probably the largest sale of property ever held in a single day took place Dec. 1 on the Centennial Grounds, when the 24 buildings belonging to the Board of Finance and a dozen structures of varying dimensions belonging to individuals or firms were exposed at public auction. The total cost value of the property offered for sale was estimated in round figures at $2,500,000, and the actual figures realized from the sale were $296,160. Machinery Hall, Horticultural Hall, and Memorial Hall, not being in the list of properties owned by the Finance Board, were not included in the list. The auction took place in Judges' Hall, about 400 people were present. The sale began with the Main Building, in which the gas pipes, elevator, and other personal property were reserved from the sale, while the chandeliers were included. The building cost about $1,600,000. The only bids for it were one of $200,000 by R. J. Dobbins and one of $250,000 by John S. Morton, Esq., who made the bid on behalf of the Permanent Exhibition Company. It was knocked down to Mr. Morton.

The two mineral annexes, costing $19,000, went for $1,000. The carriage annex, costing $55,000, sold at $4,100. The Photographic Hall was bought for $1,000; original cost, $23,000. The Art Gallery annex was knocked down for $3,050; cost, $110,000. The Judges' Hall was sold for $1,500; cost, $30,000. The Medical Department Building for $300. The Department of Public Comfort Building, which cost $22,000, for $1,000. The Shoe and Leather Building, costing $39,750, was disposed of for $3,000. The British boiler house, costing $20,976, sold for $1,150. The Corliss boiler house, costing $20,976, and containing 8,125 cubic feet of masonry, 243,450 bricks, and 25,000 pounds of iron, was sold for $1,400, for either Fairmount Park or the Franklin Institute. The Wagon Annex was sold for $850 to Samuel A. Simes, Treasurer Pennsylvania Salt Manufacturing Company. The annex to Horticultural Hall was sold for $600.

Agricultural Hall, covering 10 acres and costing $275,000, was bid for at one time at a lively rate by Messrs. Allison and Dobbins, the effect of the brief rivalry being to increase the price some $4,000. It was finally knocked down to R. J. Dobbins for $13,100. The Pomological Building, which cost $19,000, was sold for $1,250. The Butter and Cheese Building, which cost about $15,000, brought $1,100. The owner proposes to take it to Asbury Park, N. J. The Averill Chemical Paint Company's Pavilion sold for $550. The Pennsylvania Educational Hall, costing $12,000, went for $900. The British police barracks went for $650. The British workmen's headquarters for $425. The Turkish Cafe, costing $4,000, for $250.

At the close of the sale it was announced that another sale would soon be held of all gates, fences, and movable property to be removed from the grounds.

The women's Centennial Committee propose to form a Centennial League.

A despatch from Winnepeg says there is a serious outbreak of smallpox at the Gimli settlement of Icelanders on Lake Winnepeg, and that twenty deaths have occurred in the last ten days. Dr. Hynck, a physician, sent out by Lieutenant Governor Morris, has eighty cases on his hands.

Judge Jas. K. Knight, of the Mo. Circuit Court, accidentally shot himself in St. Louis, Nov. 25.

New York is soon to have a system of cheap cabs.

A statue of Daniel Webster, donated to the city of New York by G. W. Burnham, has been placed in Central Park.

The Governor of Nebraska has called a special meeting of the State legislature to count the electoral vote.

Progress is making tremendous strides in the Black Hills. Men wear collars in Custer City, and there is a canary bird at Deadwood.

Gold, 103¾@105¾.

FOREIGN NOTES.

Spades are trumps again in Paris, just as much as in the days of Hausmann under the empire. The shovel and the pickaxe are seen everywhere clearing away rubbish, to charm the eyes of visitors to the great Exhibition of 1878, which the French hope will eclipse all its predecessors.

The London Lancet says the medical profession will hear with gratification that Dr. Brown Sequard, after the long absence of thirteen years, intends to resume practice in London at an early date.

Minister Washburne is greatly annoyed by the demands of traveling Americans for recommendations for invitations to President MacMahon's State receptions.

The Khan of Khiva, in consequence of the complaints of his subjects, has offered to cede the remainder of his territory to the Russian Government.

The cost of sending a soldier to Cuba is officially stated in a Spanish journal to be 156 pesetas or francs. Each soldier receives a cash bounty of $50; a substitute receives $100 extra.

The French National School of Agriculture has a professorship of comparative agriculture or the systematic comparison of French and foreign agriculture.

The Czar of Russia has informed Lord Loftus the English Minister, that he desires peace, and does not want Constantinople.

The London correspondent of the Post telegraphs that journal as follows: "I have the authority of the Foreign Office for the assertion that the circumstantial account of the British plans which said that in case Russia should invade Turkey a British army corps would immediately occupy Constantinople and defend it against all attacks, is purely conjectural."

Letters report that the Russian Army of the Pruth has been furnished with clothing suitable for a winter campaign. The Commander-in-Chief's Staff, the commissariat, the engineering, artillery, and other staffs of the army have been formed.

The Marquis of Salisbury declared in Vienna recently, that England would not appear at the Conference as the opponent in principle of Russia. It would depend whether Russia drew up her demands in a form to guarantee the rights of the Christian subjects in Turkey without destroying the sovereignty of the Porte. He would not regard it as a violation of that sovereignty if the Porte were to enter into certain engagements with Europe regarding the Porte's subjects, and the powers were to co-operate in the introduction of guaranteed reforms.

For some time past there has been flourishing in the most lawless part of Paris a woman whose only profession was bartering food for finery. She pounced upon children whose ears, necks, or arms were adorned with jewelry, and opened the conversation by admiring the beauty of the coveted trinkets. The next step was to offer a fine assortment of cakes, bonbons, and sweetmeats in exchange, by which devise she, in an incredibly large number of cases, succeeded in swindling her victims out of their valuables. The police have at last secured her.

THE RURAL NEW-YORKER wants good local agents. Address RURAL PUB. CO., 78 Duane St.

FRANK MILLER'S HARNESS OIL received the highst and only award at the Centennial Exhibiton.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Dec. 2, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls.	94,377	Molasses	2,643
Whisky	3,270	Rice, bbls	836
Corn meal, bbls	3,758	Cut meats, pkgs	22,862
Corn meal, bags	1,018	Lard, pkgs	17,229
Wheat, bush	963,907	Tobacco, hhds	343
Corn, bush	752,365	do. pkgs	5,091
Oats, bush	469,416	Butter, lbs	25,495
Rye, bush	98,278	Cheese, lbs	17,795
Malt, bush	58,899	Cotton, bales	38,051
Barley, bush	665,245	Rosin	3,575
Beans, bush	6,372	Sulf. turp., bbls	608
Grass seed, bush	11,316	Dried Fruits, pkgs	3,259
Beef, pkgs	4,055	Eggs, bbls	14,516
Wool, bales	936	Peanuts, bags	2,581
Hops, bales	741	Leather, sides	57,001
Pork, bbls	7,020	Sugar, hhds	319
Tallow	1,348	Oil cake	18,441

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible: mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a clean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival here of summer items on Saturday.

BEANS AND PEAS.—Exports beans past week, 1,343 bbls.; since Jan. 1, 53,903 do.; same time last year, 33,577 do.

Medium beans have again advanced and holders do not seem anxious to sell even at the new prices

The supply is small and at this season a good many local buyers appear at once. Marrows are firm, having had a couple of weeks of liberal export business. Pea beans are in demand for Eastern use, but prices are high and stock is scant. White and red kidneys are quotable at full figures. Black beans have advanced. It is not often that marrows and mediums are quoted so closely together. Prices will be apt to continue firm unless we have very open weather to favor receipts. Canadian peas are steady. Green peas dull and lower. Southern Black-Eye steady. We quote:

Beans—New medium, $2.10@2.15; do. marrow, $2.25@2.30; do. pea, $2.45@2.50; white kidney, $2.35@2.45; red do., $2.35@2.40; Old Beans—Medium, prime, $1.70@2.00; marrow, $1.80@2.30; pea, prime, $2.00@2.25; white kidney, prime, $2.00@2.30; red do., prime, $2.10@2.20; black, $2.75@2.90; Canadian peas, new, ¾ bbl., free, $1.12@1.14; do. bulk, 92@95c.; green do., new, $1.35@1.40; do., S. B. E. peas (2-bush. bag), $2.10@2.15.

BEESWAX.—The receipts now are very small, and the light trading is at stronger prices. Sales at 31@32c. for Western and Southern.

BROOM CORN.—Is very dull, and unsettled in price. Quoted at 7@8c. for short green brush, 6½@7½c. for green hurl, 5@6c. for medium green, and 3@4c. for red and red-tipped.

BUTTER.—Trade in butter has not yet resumed an encouraging volume and December opens with a good deal of stock in store that should have found an outlet in November. Thanksgiving specialties have kept grocers busy during the past week and that fact has tended to narrow the outlet for that period. But a dragging feature in the market is the disproportion of fine and upper grades of stock, and the lateness of the business in dairies. The weather indicates that it may settle cold; that will help to start wholesale business and the local demand must soon reappear for replenishment. Solid weather improves the showing of stock; a good many lots that are turned aside when a mild term holds on late will then sell closer to their real merit. Western butter though comparatively low, partakes of the general dullness. All fancy creameries are higher and fine state tubs show an advance W. rolls lower.

Exports past week 2,742 pkgs.

We quote:—Choice pails, 33@34c.; prime, 32@33c.; poor to good, 26@29c.; creamery pails, choice, 36@38c.; good, 33@35c.; sweet cream pails, 32@35c. State firkins, choice, 29@30c.; fair to good, 25@27c.; do. half firkin tubs, choice, 32@33c.; fair to prime, 29@30c.; do. Welsh tubs, choice, 30@32c.; other, 24@28c.; inferior State, 15@19c.; Western creamery, choice, 35@37c.; other, 32@34c.; do. firkins, best, 21@22c.; other, 15@18c.; dairy tubs, choice, 25@27c.; other, 18@23c.; factory choice, 22@24c.; other, 13@16c.

State dairies quotable at 30@31c. with full tubs Welsh tubs, dairies, 26@29c.

State firkins dairies 25@30c. Roll butter, fair to prime, 20@22c.; do., poor, 15@17c.

COMPARATIVE STATEMENT.

	Receipts, pkgs.	Exports, firk.
June 1, '76, to Dec. 1, '76	746,136	87,801
June 1, '75, to Dec. 1, '75	668,931	22,833
June 1, '74, to Dec. 1, '74	553,634	34,107
June 1, '73, to Dec. 1, '73	563,361	22,075
June 1, '72 to Dec. 1, '72	410,686	31,755
June 1, '71, to Dec. 1, '71	421,269	49,261

CHEESE.—Trade this week has been of a more restricted character; this has been partly due to the difficulty in getting ocean freight room. The feeling as to prices has been quite firm. The receipts are falling off, and the stock of the better grades of factories is not large. The liberal requirements recently of fancy colored factories has brought this grade down materially in the supply, and there is no trouble experienced in getting 14¾@14¾c. for the best lines. Fancy white factories range at 14@14¾c., and something exceptional to 15c. The lower grades are rather neglected.

Exports past week, 21,138 boxes.

Fancy factory at 14¾@14¾c. for fancy white and colored; do., job lots, 15¼c.; good and prime, 13¾@14c.; fair, 12@12¾c. State farm dairy, fancy, 13¾@13¾c.; good to prime, 12@13c.; fair and good, 11@12c. Western factory, fancy, 13¾@14c.; good and prime, 12@13c.; fair lots, 10@11c.

Comparative receipts and exports from June 1:

	Receipts, pkgs.	Exports, lbs.
June 1, '76, to Dec. 1, '76	1,755,808	69,223,501
June 1, '75, to Dec. 1, '75	1,982,415	75,672,787
June 1, '74, to Dec. 1, '74	1,691,871	75,324,583
June 1, '73, to Dec. 1, '73	1,645,199	71,333,580
June 1, '72, to Dec. 1, '72	1,599,750	61,697,148
June 1, '71, to Dec. 1, '71	1,266,352	68,800,218

COTTON.—Export demand has been more active. The latest quotations are:—December, 12 3-32@12 21¾c.; January, 12 3-16c.; February, 12 11-32@12¾c.; March, 12¾@12 17-32c.; April, 12 11-16c.; May, 12 27-32@12¾c.; June, 13c.; July, 13¾@13 5-32c.; August, 13 7-32@13¾c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	10¾	10¾	10¾	10¾
Strict ordinary	10⅞	10⅞	10⅞	10⅞

Stained

Good ordinary	10
Strict ordinary	10⅜
Low middling	11
Middling	11½

DRIED FRUITS.—For apples, with continued arrivals, adding to an already large stock, prices are very low. It is hard to sell even small lots, with exporters indifferent. Peaches and small fruits are scarce and at strong prices.

Apples—State, sliced, 5¾@6¼c.; do., quarters, 6@6¼c.; southern sliced, new, fair, 5¾@5¾c.; choice do. 6¾c.; fancy, nominal; do., new quarters, in bags, 4@4½c.; do. repacked, 5@5½c.; Western quarters 5½c. Blackberries at 8½@8¾c. Peeled peaches, new, at 18@19c.; unpeeled peaches, halves, 9@10c.; do. quarters, 8½@9c. Raspberries, 28@29c. Cherries, 17@c.

Exports past week 780 bbls. apples; since Jan. 1st, 27,077 do., same time last year, 10,706 do.

EGGS. The demand is generally light. Very few grocers take wholesale lots this season, thus far. Cold weather may help prices, but with the present style of demand they cannot advance suddenly. Lime quiet. We quote:

Near points, 33@34c.; State and Penn., 28@29c.; Western, prime, 28@28½c.; no. Canadian, 28@28½c. State limed, 21@22c.; Western, do., 18@21c.

ESSENTIAL OILS.—The following are the current rates:

Peppermint, $2.50 ₹ lb. in tin, $3.25@3.50 in glass—tone firm. Sassafras scarce and firm at 50c. ₹ lb. Wintergreen, large supply, weak at $2.50. Spearmint, nominally $2.50 ₹ lb., no demand.

FLOUR.—There has been a very satisfactory business this week. English shippers are favored by the improved temper of the markets abroad, and have been in for considerable quantities of the low grades and have met advanced prices. The better grades, more especially Minnesotas, have been freely dealt in and higher prices paid.

The latest sales are $5.00@5.30 for poor to very choice superfine State; $5.40@5.50 for very common to fair extra do.; $5.55@5.65 for good extra do; $5.70@5.75 for fancy do., and $5.80@7 for fancy to very choice extra; $5.00@5.70 for superfine Michigan Indiana, Iowa, &c.; $5.40@5.55 for shipping extra do., the inside price for interior, and $5.60@5.70 for choice to very fancy extra do.; common to choice white wheat extras, $5.75@6.30; fancy do. $6.35@8; winter wheat, good to choice family, $6.25@8.25; round-hoop Ohio, $5.40@5.50, and trade brands of do. at $5.55@7; St. Louis, $5.40@6.50 for common to fair extra, and $6.55@8.25 for good to very choice; Minnesota "straight" at $6.35@7.85, and patent at $7.50@9.50; unsound stock at from $3.75@5.00; city mill extra for West Indies at $6.25@6.50; do. English brands, $5.50@—; do. trade and family, $7.00@8.50; No. 2 at $3.75@4.50.

FRESH FRUITS.—Cold weather strengthens the price of apples, but sales are not large, as exposure is risky. Fancy reds are quoted at $2 in a small way. Greenings unchanged, though a little firmer. Exports of apples past week, 12,830 bbls. Grapes and oranges had a fair sale for the holiday, and prices close quite strong. Cranberries have begun to move. We quote:

Apples, State, ₹ bbl., prime red, $1.75@2.00; winter, $1.37@1.50; mixed, $1.12@1.25; good to fair, 87c@$1; Cranberries, crates, $2.50@3.00; Eastern, good to prime, $7.50@10; N. J. $7.50@8.50, for good to prime. Grapes—Catawba, ₹ lb., 10@12c. Peanuts—Va., fancy, $1.30@1.35; other, 70c.@$1.15. Hickory nuts, coarse, 75c.; shellbarks, $2@2.25. Oranges—Florida, ₹ box, $4.50@6.50.

GRAIN.—For wheat there has been a very brisk demand; the advices from the other side respecting the Eastern question have been of a nature to stimulate trade, while there appears also increased demand to replenish assortments abroad. Prices have advanced. Corn is also active and at better prices. Oats have a slow trade. Barley is in large supply and depressed in price, and latest sales of wheat are of No. 3 Chicago spring at $1.22; No. 3 Milwaukee at $1.26; No. 2 Milwaukee spring at $1.31½@1.33; No. 2 Sheboygan spring at $1.31; No. 2 New York spring at $2.28; small lots of No. 1 Spring at $1.33@1.35; amber Michigan at $1.31; winter red Western at $1.30@1.31; white Canada, in bond, at $1.35; extra white Michigan at $1.43. No. 2 Chicago spring quoted at $1.30 bid and 1.31 asked. Rye at 80@84c. for western, and 92@95 for Jersey, State, Pennsylvania and Canada. Corn at 29½@30c. for mixed western. Oats at 30@43 for mixed Western and State, and 38@49 for white do.

HAY AND STRAW.—The receipts have been large, as is usual just before the close of navigation, but prices have not been affected. The low grades of shipping lots have a very fair sale. We quote:

Rale hay 60c. for shipping, 70@80c. for retail qualities; clover, 55@65c.; salt, do., 50@60c. Straw quoted at 70@75c. for long rye; 55@60c. for short rye, and 45@55c. for oat.

HONEY.—Unchanged. W. clover in grass, 15@20c.; B. W., do., 11@14c.

HOPS.—Trade continues to drag and the market is easing off a little. Exporters are indifferent, the markets on the other side not offering strengthening influences, while the demand on home account is small. Receipts are quite moderate, but there is a pretty liberal accumulation of stock. We quote:

New Yorks, good to choice, new	30 to 33
New Yorks, low to fair, new	20 to 25
Eastern, new	27 to 30
Wisconsin, new	30 to 35
Yearlings	10 to 15
Olds, all growths	4 to 8
California, new	30 to 33
Oregon	30 to 36

POULTRY AND GAME.—Tuesday and Wednesday of last week found the market pretty well clear of stale and unsightly stock and the fresh supplies of turkey found a ready market. Prices for turkeys did not run up very high—the times would not stand it—but the weather was good and crisp and steady quotations ruled for stuff that arrived time enough for retailers' use for the 30th. The display of Pennsylvania, New Jersey and State was good. Western did not crowd the market as usual at this festival, but we heard of few dealers who lamented its absence. The extreme paid for turkeys for the holidays was 16@17c. for good sized State and New Jersey and 18@19c. for very fancy do. Western sold up to 16@15c. A good deal of belated stock is in market but, fortunately, the weather is good for holding. By accounts from the interior we shall have low-priced poultry most of the season.

Turkeys, N. J., 13@15c.; State, 12@15c.; Western, 10@14c. Chickens, dry-picked, 12@15c. N. J. chicks, 11@13c.; State, 10@12c.; Western, 9@12c. Ducks, N. J., 11@14c.; State, 10@12c.; Western, 9@10c. Geese, 6@10c. for common; 11@13c. for good to best. Inferior poultry, 6@8c.

Live poultry not wanted. The low prices are nominal.

New Jersey turkeys, 10@12c. ₹ lb.; Western, 10@11c. N. J. fowls and chicks, 10@11c.; State and Penn., 10@11c.; Western, 9@10c.. roosters, 6@7c. Geese, N. J., ₹ pair, $1.75@2; Western, $1.37@1.62. Ducks, N. J., ₹ pair, 75@$1; Western, 50@63c. Live pigeons, ₹ pair, 25c.

Considerable extra trade in prime attended Thanksgiving, but the stock was pretty large and prices did not improve much. Hares and rabbits are not plenty. Drawn grouse, 50@55c. ₹ pair.

We quote.—Canvas-back ducks $1.25@1.37; Red Head 60@70c.; Mallard 60@70c.; Teal 50@55c.; Widgeon, 30@35c.; ruddies 25@30c.

English Snipe, ₹ doz. $1@—. Quail, ₹ doz., prime, $1.25@1.62, Partridge, State, 70@80; Eastern, 50@70c.; Western, 70@80c.; Prairie Hens, 75@85c.. Hares, 50@60c.; Rabbits, 30@40c. Venison, whole, 10@11c.; long saddle, 13@15c.; short do., 11@12c.

PROVISIONS.—Prices have worked up on the war news from the other side, and there is a more active export demand. Mess pork quoted at $15.87½ for spot and $16.50 for December; $16.15 for February. Bacon at 9c. for long clear and 9½c. for short clear; Western steam lard at $10.37½ on spot; $10.25 for December $10.32½ for January, and $10.10 for Feb. Stearine at 10½c. for prime. Tallow at 5½c. for prime. Beef hams at $20 for choice Western.

Beef, barreled lots, new, quoted at $10.50@11.50 for plain mess, $12@12.50 for extra mess, $13.50@14 for packet. Tierced quoted nominally at $20@21 for new prime mess and $22@21 for new India mess. City extra India mess at $26.

SEED.—Grass are in larger supply while export demand is small giving easier prices; clover quoted at 15¾c.; timothy, $1.90; rough flax at $1.00@1.02.

SUNDRIES.—Western live geese feathers prime white Western, 65@70c.; mixed, 40@50c.; live and turkey feather not wanted. Cider unchanged; 8@12c.; quality better. Ginseng, $1@1.20.

TOBACCO.—Export demand has been very light this week, while supplies are liberal and slightly easier prices in instances made.

VEGETABLES.—Exports of potatoes past week, 3,493 bbls.; of onions, 268 do. Winter weather puts a backbone in the market, potatoes especially showing firmness, and garden stuff has a steadier sale.

Potatoes—Peach Blows ₹ bbl. $3.25@3.50. Early Rose, prime, $3.25@3.50. Peerless and Jackson white, 2.62@2.75; sweet, Del. $3.00@4; Va. $2.75@3. Cabbages, ₹ 100, $4@7. Marrow squash, ₹ bbl., $1@1.25. Hubbard Squash $1.50@1.75. New Russian turnips, ₹ bush., 75c.@—. Onions—Yellow, ₹ bbl., $1.75@2.00; white, $2.50@2.75; red, $1.50@1.75. Cauliflower, ₹ bbl.; $1@1.50.

WOOL.—There has been a moderately active trade only this week. Manufacturers have bought sparingly, on account of less satisfactory goods market, while the parcels changing hands among dealers have been to a limited extent, and speculation is unimportant. Western fleeces are in small stock and firm as to price, and generally on other descriptions no important concessions made.

ROCHESTER, Dec. 2.—Flour market steady; spring, $6.75; amber winter, $7.00; white winter, $7.50; double extra, $7.75. Rye flour quiet at $5.00. Wheat quiet; Milwaukee club, $1.20@1.30; amber winter, $1.20@1.27; white winter, $1.25@1.32. Oats, nominal at 38@40c. Corn quiet at 58@62c. Corn meal, $1.25@1.50. Butter, 25@26c. Cheese, 13@14c. Eggs, 25@26c. Lard, 10c@10½c. Apples, bu., 25@40c. Potatoes, bu., 50@75c. Beans, ₹ bu., 90c@$1.70. Mess pork, $17.00. Wool, 25@35c. Hay, $11@12. Straw, $6@8. Timothy seed, $2.75@3.50; clover, $3.25@10. Mill feed strong at $14 for shorts, $16 for shipstuffs, and $20 for middlings. Railroad Freights—Flour to Boston, 35c. ₹ bbl.; to New York, 25c.; to Albany, 20c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Dec. 3, 1876.

THE market this week has been active and prices firm, with an improved tendency. Farm dairies brought from 11 to 14c., according to quality, the delivery being quite light. Factories were well represented and about 2,500 boxes of cheese changed hands. We note sales at 12¾, 12¾, 13, 13¼ 13½ and 13c. The bulk of sales may be quoted at 13¼@13½c.

Butter is coming forward quite freely. Farm dairy butter in Welsh tubs brought 27@28c. for fair to good qualities. Fancy lots and creamery went at 29@30c., and a few extra lots of extra brought 32c. for home consumption.

The weather has been very mild, with light flurries of snow. Dairymen are congratulating themselves on the fine fall weather and the saving of hay in consequence.

We have advices from abroad to the 18th of November. Our London correspondent says that really fine English and American cheese clears at extreme quotations, but secondary and inferior sorts are hard to place, though offered at a low figure. We give quotations as follows:

American, extra fine, 68@70s.; fine, 60@65s.; good, 50@56s.; secondary and low grades, 30@40s. English cheddar brings from 70@80s.; Wiltshire double, 65@67s.; Cheshire medium, 56@60s.; fine, 76@80s.; Scotch, 66@70s. Dutch Cheese—Edams, 65@68s.; Gondas, 58@62s.; Derby shape, 60@65s.

The butter market is quiet, notwithstanding a reduction of 4s. in Normandy. Really fine butter is scarce and prices come higher from the Continent. We quote:

Channels, 116@120s.; Corks, 150s.; Dorsets, 171s.; Jersey, 120@132s.; Danish and Swedish, 120@136s.; Normandy extra, 108s.; American and Canadian, 80@130s. ₹ cwt. The sales of oleomargarine steadily increase and it is taken in preference to inferior butter at 90@104s. ₹ cwt.

LIVE STOCK MARKETS.

NEW YORK, Dec. 1, 1876.

RECEIPTS OF LIVE STOCK.

BEEVES.—Trade on last Monday opened fair on a rather heavy run of horned cattle fresh to hand, the quality of which ranged from coarse to choice. Prices were 7½@11c. ₹ lb.; weights, 5½@9 cwt. All of the hards on sale were disposed of at noon. Wednesday trade opened on a heavy run of generally rough quality cattle at ½c. ₹ lb. on Monday's rates; prices were 5@10¾c. ₹ lb.; weights, 5½@8¾ cwt. Thursday, being Thanksgiving Day, trade was small. Friday, the markets closed dull at 7@10½c.; weights, 5¾@8½ cwt. From 45@57 lbs. net., has been allowed. Colorado steers sold at 7@7¾c. ₹ lb.; Cherokee do., 8½@8¾c.; native, 8@10c.; grade, 10¾@11c. Dry cows, 8½c. Oxen at 8@9¾c. Bulls, live weight, 3½@4¼c. Mixed herds, 8@9¾c. ₹ lb.

MILCH COWS.—Trade dull and small. Sixteen cows sold at $100@65 ₹ head; 14 do., $45@91 ₹ head; 10 do., $60@72 ₹ head—calves always included.

VEALS AND CALVES.—Smooth quality veals scarce and slow of sale at 8@10½c. ₹ lb. Coarse quality calves in heavy supply and very slow of sale at 5@6c. ₹ lb., also at $1@5 ₹ head. State veals, 8@10½c.; Pennsylvania do., 9@10c. State calves, $6@14.50 ₹ head; Western do., $7@18 ₹ head. Country dressed veals in fair supply; sales effected at 11@12c. ₹ lb. Country dressed calves, 5½@7c. ₹ lb., trade moderate. Yearlings, $12@13 ₹ head.

SHEEP AND LAMBS.—Trade moderate in both sheep and lambs. Monday, sheep sold at 4½@6½c. ₹ lb.; lambs at 6½@7c. Wednesday, sheep, 4@6½c.; lambs, —@—c. Thursday, trade so small as not to affect the markets. Friday, the markets closed —; sheep sold at —@—c.; lambs, —@—c. Jersey ewes, 4@5½c. ₹ lb.; Canada do., 5½@6c. Jersey sheep, 6½c.; Canada, 5¾@6c.; Ohio, 4½@5¾c.; State, 4¾@6¾c.; Pennsylvania, 6¼c.; Indiana, 4¾@5¾c.; Kentucky, 4¾@5¾c.; Michigan, 5@5½c.; Illinois, 4¾@5¼c. State lambs, 6¾@7c.; Canada, 5¾@6¾c. Mixed flocks, 5½@6¼c.

HOGS. Trade in live hogs very slow, those to hand being held over from one day to the next, and even for two days. During this past week, 1,356 Ohio hogs, average weight 230 lbs. ₹ head, sold at 5¾@6c. ₹ lb. Six car loads held on sale. Trade in city-dressed fair at low rates, being 7@7½c. for hogs. Jersey pigs, country dressed, 8@9c.

HORSE MARKET.—Trade fair in inferior quality animals. High-priced horses held on sale. Contracts for city railroad horses filled at $85@125 ₹ head; do. for stage-line horses, $120@190; 22 head poor quality, light harness horses sold at $55@105 ₹ head; 18 do., $60@90; 50 do. ordinary quality, $100@180; 13 roadsters, with fair trotting action, not warranted sound, $200@400 ₹ head; 11 pairs family carriage horses, $275@525 ₹ pair; 3 pairs stylish do., not warranted sound, $700@925.; 1 pair do., sound, $1,200; 3 trotters, $375@500 ₹ head.; 1 do., choice quality, $800.; 1 pony, $80; 1 pair choice quality heavy draft horses, $350; 60 head coarse quality do., $62@150 ₹ head.

PERSONAL ITEMS.

DISRAELI has $25,000 a year, and he lives like a hermit.

THE book an author is going to write is always his best work.

THE Duchess of Edinburgh has been confined of a daughter at Malta.

WHY is a chicken like a farmer? Because both delight in a full crop.

SENATOR-ELECT Teller of Colorado, is a great railroad lawyer, and a warm Methodist.

AN English writer compliments Elihu Burritt by saying that "he looks as though he had just dropped out of the Old Testament."

"WHAT does England think of Mr. Tupper?" an American asked Tennyson. "England does not think of him," replied Tennyson.

RUSSIA has 170,000 wolves within its boundaries, and they destroyed last year not only an enormous quantity of cattle and poultry, but also two hundred people.

SIR CAREL FITZGERALD, a young Baronet who had been arrested in London for driving a cab without a license, has taken out a regular cabman's license.

BY the terms of an election bet, one man in Worcester will eat a sumptuous dinner while another, who pays the bill, will sit at the same table and eat six cold potatoes.

MISS MARY P. THACHER, who has recently published a book of rustic sketches, is related to Mr. Longfellow, and has had the benefit, Col. Higginson says, of his counsel and guidance.

COMMODORE VANDERBILT persists. Disease finds him a tough customer, and in the wrestle gets thrown every time. It is evident that the Commodore comes of a stock that hadn't been watered.

A BLIND voter in Goshen, N. H., was taken to the polls late on election day, and, in the haste, he was tumbled out of the wagon and his leg broken. He was carried to the polls, screeching with pain.

A TROY quack doctor promised to cure a consumptive woman with cucumbers, in which he said he had discovered an infallible remedy. Three cucumbers killed her; yet he has sued her husband for $50 pay.

THE "American Humorists" are busy Mr. Bret Harte and Mr. Mark Twain are said to be writing a play together. The rumor that Mr. Josh Billings and Mr. Eli Perkins are also to be called in as collaborateurs is not yet authenticated.

SCENE in a debating society: President—We will take the ayes and noes on the previous question. Member—A word or two, Mr. President: Friends, Romans, Countrymen! lend me your ears—. President—Order, sir! We will take the eyes and nose first.

AN inquisitive Frenchman announces triumphantly that Paris consumes on Good Friday 280 pounds of salmon, 110,000 pounds of cod, 5,000 pounds of skate, 40,000 pounds of red herring, 8,000 pounds of shad, 3,000,000 pounds of eggs, and 6,738 pounds of butter.

THE happiest moment in the life of a girl is when she is in possession of a lover, a chair that holds twice at once, and a pa who trusts to her experience. It will be sad for her when that lover becomes a belated husband, standing on the door step, crying, "Throw down some key holes—assorted sizes."

MISS FLORENCE SPARKS, daughter of the late Jared Sparks, editor of Washington's and Franklin's epistolary remains, has just been married in Cambridge to Mr. Benjamin P. Moore. The venerable Dr. Peabody knit the knot there's no untying, and Mr. Longfellow was one of the many notable people present.

ALBRECHT DURER'S "Hercules Killing the Stymphalian Birds," which had long been thought hopelessly ruined by being so overlaid with oil color and varnish, has just been successfully restored. The painting now looks fresh and beautiful. It bears Durer's monogram and the date, 1500, and belongs to the artist's early time.

DR. STROUSBERG, the bankrupt and railway contractor, who has just been banished forever from Russia, strangely enough, doesn't think highly of the business capacity of Germans. He says:—"The German is highly scientific, he deals largely in principles, and considers himself much more intelligent than the people of other countries.

"I WANT you to play something brilliant and dashing," said young Mr. Romeo to the organist arranging for the music at his wedding; "none of those old, die-away, worn out things usually played." "How would Beethoven's symphony, in E minor, arranged as a fantasia in four flats and one slop to the high C, suit you?" inquired the musician. "Well," said the bridegroom-elect, evidently puzzled, "if it's got the ring and go of the 'Skidmore Guards,' or 'Tommy, Make Room for your Auntie,' in it, I think it'll do.

CARDINAL ANTONELLI'S colossal fortune will, it is said, be devided equally among his brother, Count Angelo Antonelli, and three other members of his family, and he has left his valuable and unique collection of precious stones and rare marbles to the Vatican Museum. He inherited much wealth from two uncles. His salary as Cardinal Secretary of State was, it is reported, only $2,500 a year. It is mentioned as one of his admirable traits that, even when most overwhelmed with business and the cares of State, he never omitted for one single day to visit his mother, for whom he entertained the most filial affection.

Implements and Machinery.

Traveler's Guide.

CALIFORNIA.
Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?
The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTHWESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oskosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.
This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.
This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.
For rates or information not attainable from your home ticket agents, apply to
MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN
BETWEEN
NEW YORK AND CHICAGO
via Cleveland.
Leaves Erie Railway Depot, foot of Chambers St. New York.
9:00 A. M., Daily except Sunday. Drawing-Room Sleeping Coaches through to Chicago; but one change of day cars.
7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars
The only line running Hote Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer.*

It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.

G. Marti, Houston, Texas.—I inclose a flower and leaf of a wild plant, much resembling an Ageratum, except that it is more floriferous and the flowers are of a pure white. It is a perennial, growing in its wild state in a poor upland soil, attaining the hight of one foot. But, planted in the garden, it makes a stately bush of three feet in hight and diameter, completely covered with its thousands of snowy white corymbs. It blooms late, sometimes with Chinese Chrysanthemums, with which it contrasts finely. It is just the thing to mix in bouquets. Friends that see this plant in my garden ask to whom I sent for it—while they have trodden upon it many times, perhaps, in its wild state. It is *Eupatorium ageratoides*.

J. R. W.—The Jerusalem Artichoke has long been used for feeding stock, as we have already stated in the RURAL. We published, some time since, a note from a correspondent residing in South Carolina, if we remember aright, who said that he had found this plant one of the most profitable of any he had ever tried for fodder and that his cows were exceedingly fond of the leaves and young stems. Had you read the "Domestic" column of the RURAL NEW-YORKER carefully, you might have found two recipes for cooking artichokes in the issue of Nov. 18, which see. But the Jerusalem Artichoke of which we have been saying more or less of late, is quite a different plant from the *Cynara scolymus* or Globe Artichoke. The latter is not a tuberous-rooted plant, and the only portion used is the undeveloped flower-head, or the scales of the involucre.

A. B.—We are inclined to think that your failure to make Catalpa seed grow was owing to one of two causes. The seeds borne on trees in our northern climate sometimes fail to fully mature, and although they may appear to be well filled, the seed itself is immature, and does not possess vitality enough to produce a plant.

Again, it frequently happens that when such delicate seeds as those of the Catalpa are sown in the open ground that the young plants are burned off by the hot sun almost so soon as they appear above the surface. We have known instances of this kind where a very good show of young seedlings could be seen in the morning, and scarcely a vestige of them remained the following evening. The safest plan is to sow such seeds in frames or in a narrow bed along the north side of a board fence, where the young plants will be partially shaded while young or during the entire first season of growth. Get good seed, and keep them in the pods or a cool room until spring and then sow in half shady beds, and we think you will find no difficulty in making them grow.

J. J.—The *Erianthus Ravennæ* is a very large, coarse-growing grass, with long, handsome plumes or flower spikes, but the leaves are too coarse to be valuable as a forage plant. It is quite hardy in ordinary winters in the vicinity of New York City and probably much further north, but will probably never be cultivated, except for ornamental purposes.

E. H. N.—Read the Poultry department of the RURAL during the past two months and you will find all your questions fully answered, with perhaps the one exception of keeping hens in a plastered room. There can be no objection to this, for the neater and cleaner their quarters are kept the better.

Farmer's Son, Lake George.—I wish to ask upon what animals subsist that live in a half-torpid condition during the winter?

ANS.—When there is no food in the stomach, the veins and what are called lymphatic vessels absorb the fleshy parts reintroducing them into the circulation. The action of the vessels of nutrition and the lymphatic vessels when unequal causes either emaciation, as in sickness, or excessive flesh—according as the latter or former are more active. In prolonged sickness, as in consumption, not only the fat but the muscles are absorbed.

Those animals which live in a half-torpid condition for long periods may be said to live upon themselves, appropriating that which may for the time be spared, for the support of the vital functions which cannot continue without nutriment.

J. C. Cartwright.—As soon as the buds of my Camellias are well formed, the scales begin to turn brown upon the edges and after awhile the buds drop off. What is the cause?

ANS.—When Camellias are forming and maturing flower buds, earth about the roots should never be permitted to dry out. It may be that your room is kept too warm. Either this or that is doubtless the cause of the buds dropping off.

Trees, Seeds, Plants, &c.

New Publications.

1850 Twenty-Eighth Year 1877

OF THE

RURAL NEW-YORKER.

THE GREAT ILLUSTRATED AGRICULTURAL AND FAMILY WEEKLY has

REDUCED ITS SUBSCRIPTION PRICE

For 1877.

It is the Standard Authority on AGRICULTURE, HORTICULTURE and DOMESTIC AFFAIRS, and is replete with news and improvements of value to

The Farmer,	**The Dairyman,**
The Horticulturist,	**The Housewife,**
The Stock Grower,	**The Girls and Boys.**

In addition to these Practical Subjects and its Market Reports, several pages are devoted to Household Recipes, pleasant Stories, Reading for the Young, Sabbath Reading, Fashions, News, and all topics of interest to the family. Thus it comprises

TWO PAPERS IN ONE

and cuts like a two-edged sword into the affections of the ladies and children, as well as the members of the family who seek instruction in their daily avocations.

A. S. FULLER, the celebrated Horticulturist, is Editor-in-Chief, assisted by E. S. CARMAN, the well-known Floriculturist and writer on Rural Topics, and X. A. WILLARD, the great practical Dairyman, who call to their aid as special contributors, S. B. PARSONS, Horticulturist and collector of rare exotics; WILLIAM ROBINSON, Editor London Garden; Col. F. G. SKINNER, Editor Turf, Field and Farm; Prof. CHAS. V. RILEY, Missouri State Entomologist; HERMAN STRECKER, Lepidopterist; WM. J. FOWLER, writer on Farm Economy; THOS. MEEHAN, Editor Gardeners' Monthly; JAMES VICK, the great Rochester Florist; GEO. SUCH, Floriculturist; JOSIAH HOOPES, noted Botanist; S. B. PECK, M. D., writer on Hygiene; HENRY HALES, the practical Poultry Breeder; L. A. ROBERTS, writer on Historical Subjects; and a host of other gentlemen equally celebrated and learned, as well as an efficient corps of Special Reporters, to keep the readers informed upon all subjects of interest to the Rural population.

From the pens of such celebrated writers the Practical and Scientific Departments receive life, while the Literary and Family Departments are under the careful supervision of a corps of experienced Editors and Contributors, who successfully devote their energies to making this Journal the superior of any in the land.

It contains each week sixteen pages of instructive and interesting reading, embellished with fine engravings upon all interesting subjects.

The Reduced Price is only $2.50 a year, postage prepaid by Publishers, and in clubs of ten or more only $2 a year.

The RURAL is so well known that little difficulty is experienced in forming a club in any locality, and every one is invited to form a club—thus securing their paper cheaper and benefiting their neighbors.

Every one can have a specimen copy FREE, and, if they desire to form a club, a list of Premiums to Club Agents, by addressing

RURAL PUBLISHING CO.,
78 Duane St., New York.

PROSPECTUS FOR 1877.

LIPPINCOTT'S MAGAZINE,

AN ILLUSTRATED MONTHLY OF

Popular Litetature, Science & Art.

ANNOUNCEMENT FOR 1877.

The number for January begins the nineteenth volume of this Magazine, and while its past record will, it is hoped, be deemed a sufficient guarantee of future excellence, no efforts will be spared to diversify its attractions and to provide an increased supply of

POPULAR READING IN THE BEST AND MOST EMPHATIC SENSE.

The great object and constant aim of the conductors will be to furnish the public with **Literary Entertainment of a Refined and Varied Character**, as well as to present in a graphic and striking manner **the most recent information and soundest views on subjects of General Interest**; in a word, to render **Lippincott's Magazine** strikingly distinctive in

THOSE FEATURES THAT ARE MOST ATTRACTIVE IN MAGAZINE LITERATURE.

The contributions now on hand, or specially engaged, embrace a highly attractive list of

Tales, Short Stories, Descriptive Sketches, Narratives, Papers on Science and Art, Poems, Popular Essays, Literary Criticisms, Etc., Etc.,

BY TALENTED AND WELL-KNOWN WRITERS.

A large proportion of the articles, especially those descriptive of travel, will be

PROFUSELY AND BEAUTIFULLY ILLUSTRATED.

The pictorial embellishments of the Magazine constitute one of its many attractive features.

In addition to the GENERAL ATTRACTIONS of LIPPINCOTT'S MAGAZINE, the Publishers would invite attention to the following

SPECIAL FEATURES FOR 1877.

1. A new serial story,

"THE MARQUIS OF LOSSIE,"

by GEORGE MACDONALD, author of "Malcolm," "Alec Forbes," "Robert Falconer," etc.

To those of our readers who are familiar with "Malcolm," this new story from the pen of this distinguished writer will need no recommendation, and his reputation is a guarantee to others of a deeply interesting and powerful story. It began in the November number, which issue, with the December part, will be furnished gratis to all new subscribers for 1877.

2. A profusely illustrated series of sketches of

SWEDISH SCENERY AND LIFE,

by Prof. WILLARD FISKE of Cornell University, who is thoroughly familiar with Sweden and its People from personal observation.

3. A series of popular papers on

ART AND ART MATTERS,

by EDWARD STRAHAN (Earl Shinn), author of "The New Hyperion," etc.

4. Illustrated Sketches of Travel, entitled

PICTURES FROM SPAIN,

by EDWARD KING, author of "The Great South," etc.

5. Mrs. LUCY H. HOOPER'S Interesting and Piquant

PAPERS AND LETTERS FROM PARIS

will be continued through the year.

6.

THE BEAUTIES OF THE RHINE

will be described in a richly illustrated series of papers.

7. During the year will appear a number of handsomely illustrated short articles, descriptive of Life, Travel and Adventure in the United States, England, South America, Japan, Mongolia and other countries.

FOR SALE BY ALL BOOK AND NEWS DEALERS,

Price 35 Cents.

TERMS.—Yearly Subscription, $4; Two Copies, $7; Three Copies, $10; Five Copies, $16; Ten Copies, $30, with a copy gratis to the person procuring the club. Single number, 35 cents.

NOTICE.—The November and December Numbers, containing the earlier chapters of "The Marquis of Lossie," will be presented to all new annual subscribers for 1877.

SPECIMEN NUMBER mailed, postage paid, to any address, on receipt of 20 cents.

TO AGENTS A LIBERAL COMMISSION WILL BE ALLOWED. Address

J. B. LIPPINCOTT & CO., Publishers,
715 & 717 Market St., Philadelphia.

New Publications.

THE YOUTH'S COMPANION

A WEEKLY PAPER FOR

YOUNG PEOPLE

AND THE

FAMILY

THE COMPANION aims to be a favorite in every family—looked for eagerly by the young folks, and read with interest by the older. Its purpose is to interest while it amuses; to be judicious, practical, sensible, and to leave really permanent worth, while it attracts for the hour.

It is handsomely illustrated, and has for contributors some of the most attractive writers in the country. Among these are:

J. T. Trowbridge,	Louisa M. Alcott,
Edward Eggleston,	J. G. Whittier,
James T. Field,	Louise C. Moulton,
Rebecca H. Davis,	C. A. Stephens,
Mrs. A. H. Leonowens,	Harriet P. Spofford,
Edward Everett Hale,	Julia Ward Howe.

Its reading is adapted to the old and young; is very comprehensive in its character. It gives

Stories of Adventure,	Stories of Home and
Letters of Travel,	School Life,
Editorials upon Current Topics,	Tales, Poetry,
Historical Articles,	Selections for Declamation,
Biograph'l Sketches,	Anecdotes, Puzzles,
Religious Articles,	Facts and Incidents.

Subscription Price, $1.75. Specimen copies sent free. Please mention in what paper you read this advertisement.

PERRY MASON & CO.,
41 Temple Place, Boston, Mass.

THE NURSERYMAN'S DIRECTORY.

A REFERENCE BOOK OF THE NURSERYMEN, FLORISTS, SEEDSMEN, TREE DEALERS, HORTICULTURAL IMPLEMENT MAKERS, &c., OF THE UNITED STATES.

Volume II. Ready January 1, 1877.

Advertising rates low. Address the publishers for space and prices. The book is indispensable for every Nurseryman, Florist or Seedsman in the Country. It gives the Name, Post-Office and Business of those engaged in any of the departments of the Nursery Trade, alphabetically arranged by States and Post-Offices, making the Book of easiest reference. Price $10 per copy.

Address D. W. SCOTT & CO., Publishers, Galena, Illinois.

ARTHUR'S

Illustrated Home Magazine.

Year after year the Home Magazine continues to gain in favor with the people. Taking rank with the best periodicals of the day, it claims

1877

to be, in its peculiar character and varied departments, more thoroughly identified with the people in their common life and social interests, than any other magazine of its class.

Terms, $2.50 a year; 3 copies $6.00. For $12.00, six copies and one extra to club getter. *Specimen number 10 cents.*

GREAT PREMIUMS For 20 subscribers at club rates, we give as a Premium, a copy of our Great National Picture of all the Presidents of the United States, elegantly framed in heavy Walnut and Gilt Moulding. The most valuable premium ever offered for subscribers at club rates.

Home Magazine for sale by News Dealers.

T. S. ARTHUR & SON, Philadelphia

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

MOORE'S RURAL NEW-YORKER.—With its full corps of editors, and a new publisher of energy and ability, the management propose to celebrate the quarter-centennial of the pioneer RURAL in such a manner as to augment its popularity and usefulness. For a first-class, lively paper, containing matter of interest for all classes, take the RURAL NEW-YORKER, and do so at once, for the paper never was better, and its prospects never brighter.—*Freeport (Ill.) Journal.*

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend as a present, at our lowest club rate—only $2.00, including postage.

MOORE'S RURAL NEW-YORKER is one of the readable, useful, family papers, equally in demand by the lady in her conservatory, the matron with her household, the farmer in his field, the stock raiser among his animals, and the young folks around the evening lamp.—*Lowe of Life.*

Wit and Humor.

AMOS'S BOOK-KEEPER.

We asked Amos how his boy was getting on at school.

"Pleg take dat boy; I done tuck him 'way from that school."

"Why; what for?"

"Uh, oh! he wus gittin' 'mos' too smart down dar wid dat book-larnin'. 'Twon't do fer some niggers ter be too agikatid."

"Why not, Amos?"

"Well, sah, just take dat boy, frinstance. I put dat boy ter keep books fer me 'bout de sellin' ob de garden truck, dis summer. Well, sah, he jess rit down charges dar in de book fer all de truck dat I tuck out de garden' an' charges fer all dat we eat in de house, an' den credit hisself wid de little 'mounts dat I let him hab 'long at odd 'casions, an' den he go an' add dem all up, an' struck er balunce, he say!"

"And how did you come out?"

"Come out? 'Fore de good Marster, I didn't come out at all! Dat boy done stuck me for 'bout thutty-fibe dollars, 'sides his wages as de book-keepah. Now dat's what de figgers sed."

"Well, what did you do?"

"I jess burn up dat book right dar an' den, 'scharges de book-keepah, an' hire him ober agin to saw wood fer his board an' close."

"You did?"

"Yes sir, I did dat. Why, boss, ef dat boy had kept dat book on me tell now he'd own dat house an' gyardin' patch an' chargin' me an' his old mammy fer bed an' board! I tell yer dis hyar book-larnin' is ruinin' dis young breed ob niggers—'tis, shore!"

SPARKS AND SPLINTERS.

A Counter Irritation.—Short change from a shopman.

Motto for an orphan asylum—"Thus far and no farther."

A sweet thing in literature—The Confectioner's Journal.

Every old maid can boast of two beaux, but they are elbows.

"What is the width of a broad grin?" Something less than a smile.

Punch once told a droll story of a man, who, being suddenly raised to riches, exclaimed, in the fullness of his satisfaction, "Oh, that I could stand in the road and see myself ride by in my carriage."

The Greatest Joiner.—The lawyer; he can place a tenant, empannel a jury, box a witness, bore the court, chisel a client, augur the gains, floor a witness, cut his board, nail the case, hammer the desk, file his bill, and shave a whole community.

"W——, do you know why you are like a donkey?" "Like a donkey?" echoed W——, opening his eyes wide. "No, I don't." "Do you give it up?" "I do." "Because your better half is stubbornness herself." "That's not bad. Ha! ha! I'll give that to my wife when I get home." "Mrs. W——," he asked, as he sat down to supper, "do you know why I am like a donkey?" He waited a moment expecting his wife to give it up. But she didn't. She looked at him somewhat commiseratingly as she answered: "I suppose because you were born so."

A Business Girl of Chicago. When a Chicago girl received a despatch from Wisconsin, announcing that her lover was going off with consumption she telegraphed to his friends: "Has poor Jeffrey kept up his life insurance?" The friend telegraphed back: "Policy for $10-000 in your favor is paid up till May 9, 1877. Poor Jeffrey cannot last after the first cold snap." The young lady then wondered philosophically how she would look in black, and telegraphed to Jeffrey:

"Darling, I will be with you on Tuesday, never to quit you during life. Lurline."

"It will be a sad loss to you, my love," said her mother. "Yes ma," sobbed the girl, "but the loss is fully covered by insurance."

A Suggestion.—A well-to-do citizen of Detroit almost had the breath knocked out of him by the request of a ragged sidewalk tramp, who stopped him and asked: "Say, can't you lend me $10-000?"

"What! Who are you, sir? No, sir. I can't, sir!" exclaimed the citizen.

"Couldn't possibly do it, eh?"

"No, sir."

"Tell you what you might do," suggested the tramp. "You might hand me fifteen cents now and lend me the balance when times get a little easier."

"I can't lend you a shilling, sir, or a cent, sir, and I won't give you a penny, sir."

"Sorry both of us happen to be so hard up at once," sighed the tramp, and he continued his lk.

PERTINENT.

Pat.—"Faith and Jack Roony's after takin' a trip to the States Prison, for beatin' and kickin about some strange woman."

Tim.—"Beatin' and kickin' about some *strange* woman! And phat made the fool do that? Ain't he got a wife of his own, sure?

H. W. JOHNS' PATENT.
ASBESTOS MATERIALS.

Asbeston Roofing, with white Fire Proof Coating, for steep or flat Roofs in all climates.
Roof Coating, for restoring and preserving Roofs.
Cement, for repairing Leaky Roofs.
Roof Paint, for Tin Roofs, Ironwork, &c.
Asbestos Paints—all colors—ready for use.
Fire Proof Coating, for Wood work, &c.
Asbestos Steam Pipe, and **Boiler Coverings.**
Asbestos Steam Packing, flat & round, all sizes.
Sheathing Felts, Vermin Proof Lining, &c.
These articles are ready for use, and can be easily applied by any one. Send for Pamphlets, Price-Lists, &c.

FINE TEAS

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.
We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY, (and allow no middlemen to make any profit on our importations,) which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only in large cities and among the very wealthy.

The Herdsman.

AYRSHIRE CATTLE.

THE Ayrshire is one of the four most popular breeds of cattle at present raised in this country or Europe. They are quite distinct from all others of what are termed the middle-horn breed, although evidently closely allied to them. Their origin is enveloped in obscurity, but it is known that the Ayrshire, as a distinct breed, cannot be traced back a century.

For many years the Ayrshires were considered the best lactiferous breed in Great Britain, and were exceedingly popular in Scotland, not only in Ayrshire but in Renfrewshire, Sterlingshire and the surrounding country. The dairymen of the regions where this breed first made its appearance are said to have guarded them with jealous care and sedulously appropriated them to dairy purposes. Like all the more valuable butter breeds the Ayrshires are not so profitable for the shambles as the Short-Horns, although the beef is of good quality, possessing a fine admixture of fat and lean, still there are other breeds which rank higher for the value of their flesh.

The merits of the Ayrshires may be briefly summed up as follows:— They are well adapted to hilly regions, being of moderate size and sure-footed, therefore they can obtain forage where a more bulky breed would fail to procure food in sufficient quantities to keep in flesh. They are also very industrious in seeking their food, taking that which some other breeds would reject and feeding while others would be sleeping. They are excellent for milk and some of the largest milk and butter yields on record in this country were from Ayrshire cows. We note a few as examples of what the Ayrshire cow will do under favorable circumstances.

Lady Kilburnie, an Ayrshire cow owned by the STURTEVANT BROTHERS, Farmington, Mass., is reported to have given in one year 7,429 pounds of milk, equal to 3,455 quarts. Her weight was 850 pounds. Georgia, a cow owned by the same parties, and weighing 890 pounds, has given 7,127 lbs of milk in a year. A. A. MOORE of East Berkshire, Vt., a few years since, reported that he had a cow three-fourths Durham and one-fourth Ayrshire, which gave 60 lbs. of milk per day, and from which he made 16 lbs. of butter in a week. The Ayrshire cow, Sybil, according to FLINT'S abstract report, 1874, gave in one year 13,065 lbs. of milk. Jean Amour, another noted Ayrshire cow, weighing 967 lbs., is reported to have averaged fifty-two pounds of milk during ten days in June, yielding 14½ lbs. of butter per week.

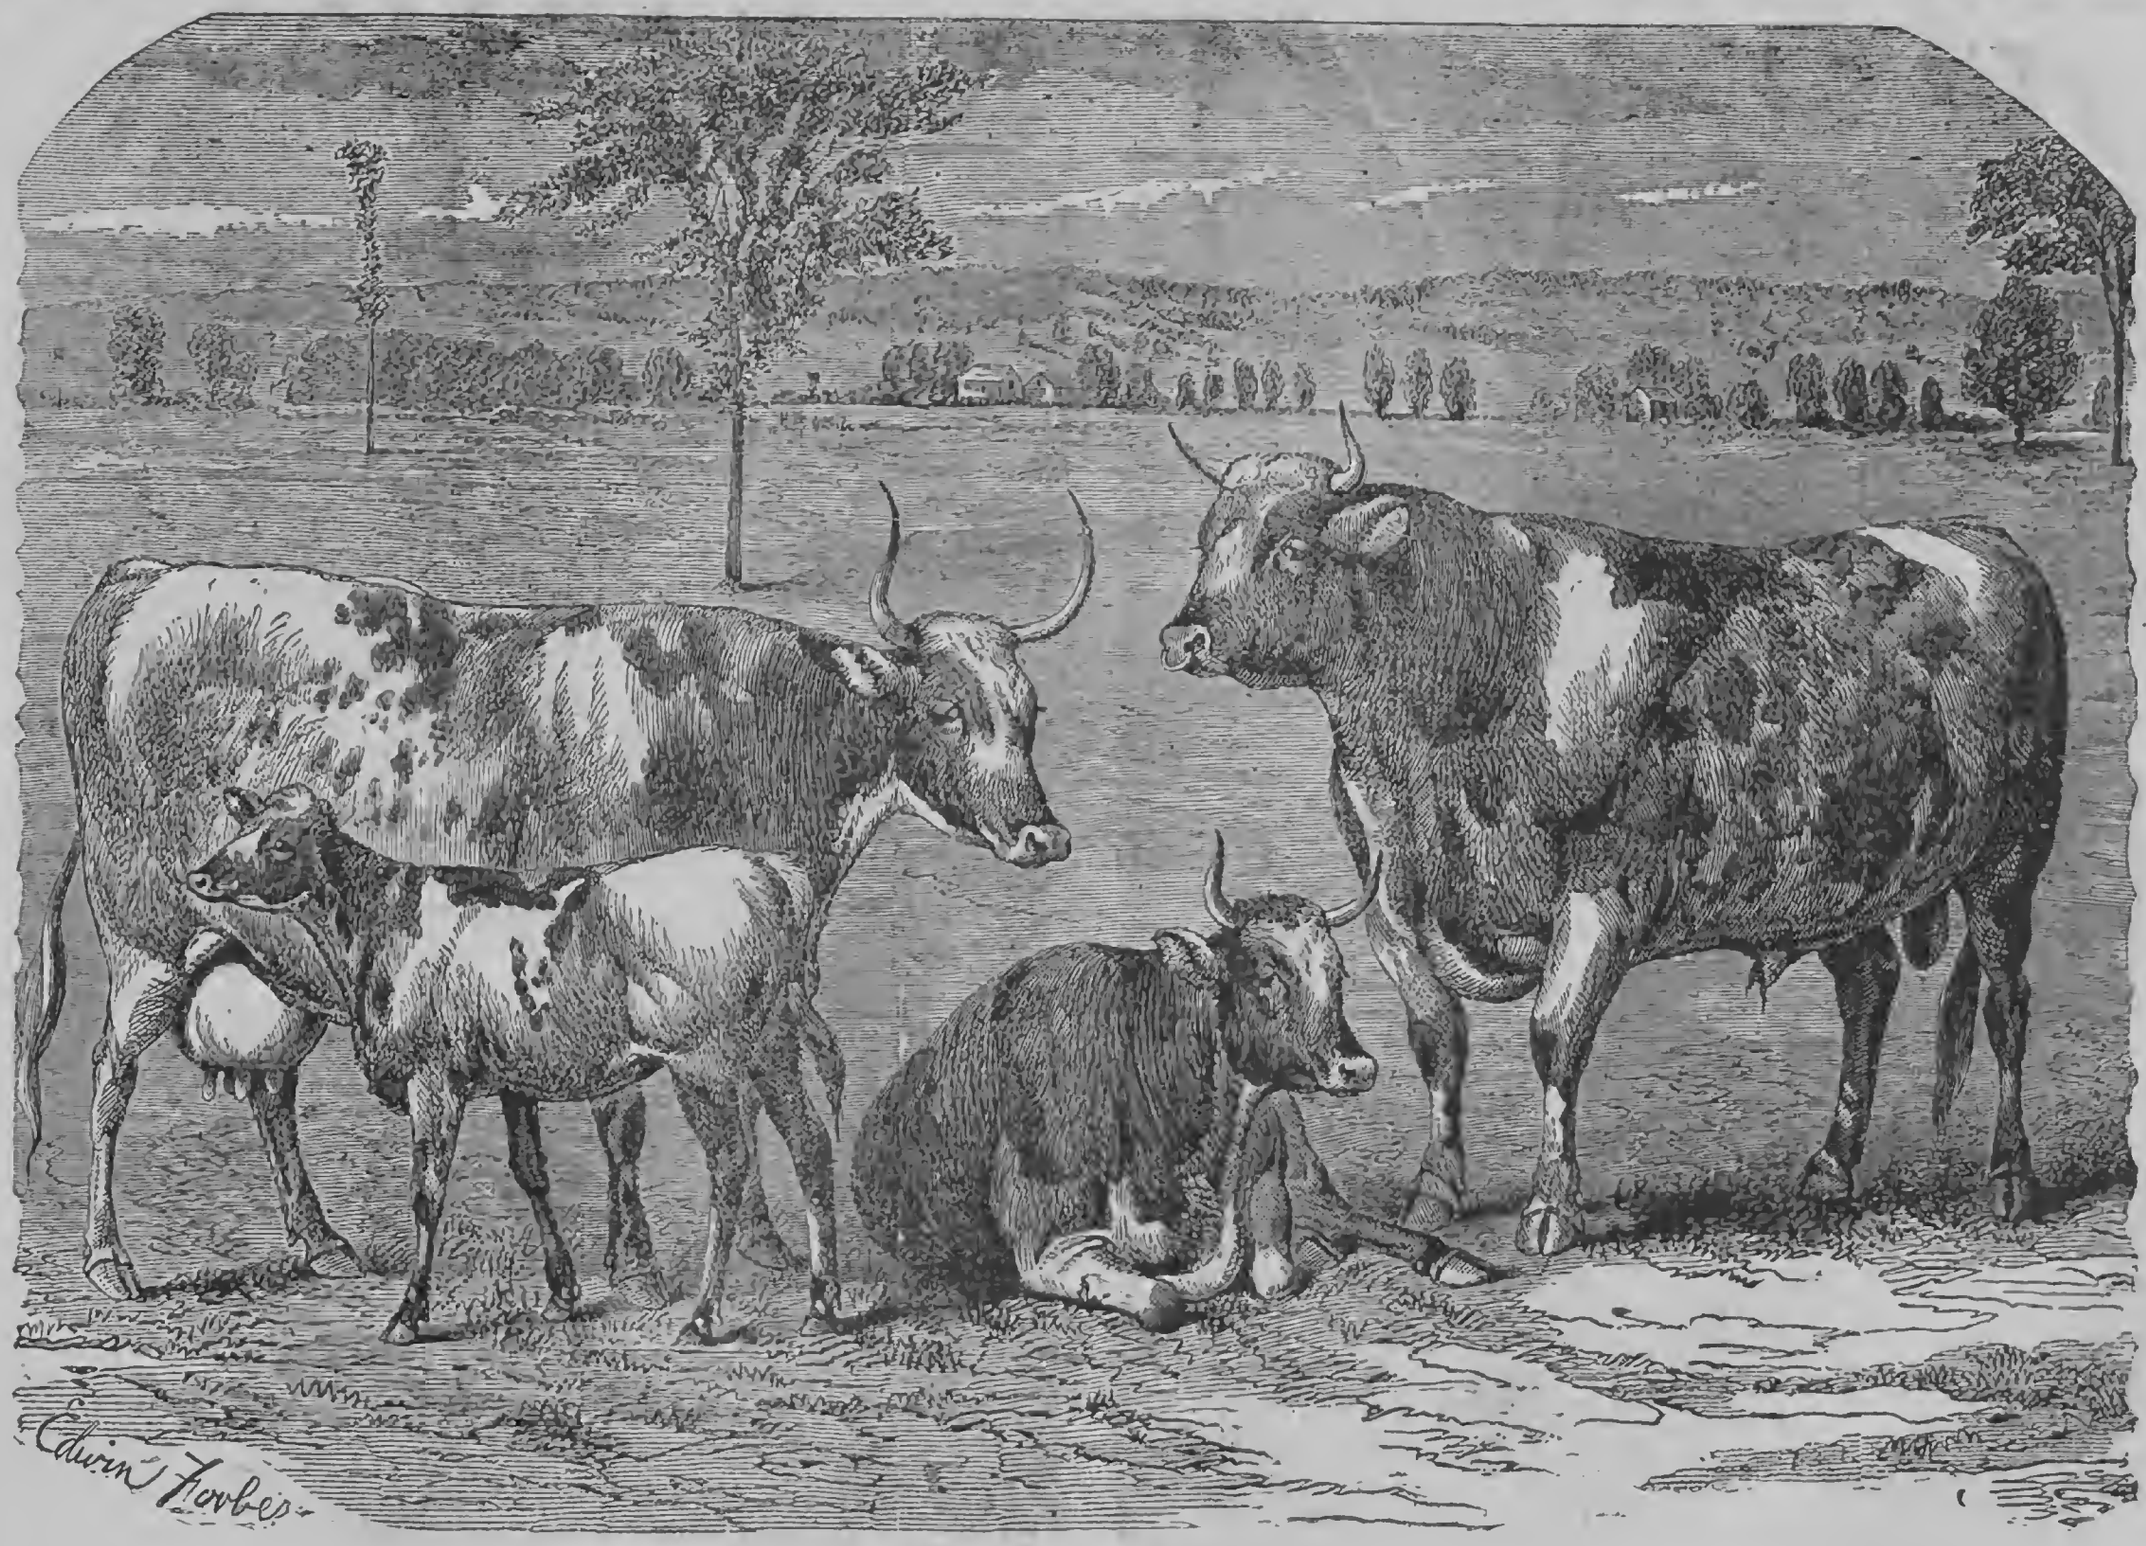
Large as the above yields may appear they have been exceeded in this country and in Great Britain, but those named are fully sufficient to show the capabilities or value of the Ayrshires for dairy purposes.

CHARACTERISTICS OF THE AYRSHIRE.

The accompanying illustration of a group of pure Ayrshires, drawn from life for the RURAL NEW-YORKER, will give our readers a very good idea of the appearance of this noted breed, but we add a brief general description. The back of pure Ayrshire cattle is straight and nearly level, yet has a slight depression at the top of the shoulder, and a slight tendency to another over the loins; the ribs are pretty round; the sides deep and sometimes showing a slight deficiency in the filling up of the buttock. The breast in front is comparatively narrow; the upper surface of the carcass shows less breadth at the shoulder than at the back, showing a kind of wedge-shaped outline. The length of the body is proportionately greater than the hight; the legs comparatively short; the muzzle is fine; the face broad but rather short; the eye is complacent; the expression of the face is gentle but dull; the horns short and turned up; the skin smooth and thin; the touch is good, but lacks the mellowness which accompanies a thick and soft skin; colors are red and white, like those of the Short-Horn, but usually lack the rich hue. They are sometimes mixed with black, and are always arranged in patches which are generally irregular in form.

Just as we finished the above sentence, a farmer who formerly kept fifty cows on his farm in Jefferson Co., N. Y., walked into our sanctum and after the usual salutation we asked—"How about Ayrshire cattle for the dairy?" He replied—"There is nothing to be found better. They will thrive under conditions where some other breeds would half starve. Just give an Ayrshire cow a chance at a straw stack and she will go through the winter and come out fat, giving a show of milk all the time. I tell you, the Ayrshires never fool around after fine pickings, but are always ready to work for their living, and do not mind staying up late nights to get their fill." To all of which we readily assented, for the best cow we ever saw a pail set under was a grade Ayrshire. But we presume there are more of the same sort to be found among the breeders of these famous cattle.

Other breeds may be more popular, and in fact more valuable to the farmer under certain circumstances and conditions than the Ayrshires, still the latter possess merits not to be found in any other breed; and to learn just where they will fit in and give the greatest profit on cost and care bestowed, is the test of a breeder's skill in stock raising of any kind.



AYRSHIRE CATTLE.

Dairy Husbandry.

A VITAL QUESTION IN DAIRYING.

THERE are many sections in the dairy districts where the growing of stock for dairy purposes has, for many years, been abandoned. The time will soon be at hand when the dairyman must determine whether he is to continue the old practice of slaughtering all his calves in spring, or whether he will commence raising stock by selecting from his best cows. The practice of buying anything and everything that is offered for filling up the herds cannot be sufficiently deprecated. Many of the animals bought from droves at high prices do not pay the cost of keep, and the opinion has come to be pretty general that the best way to secure good cows is to raise them on the farm. The difficulty in obtaining superior milch cows to supply the many and large herds in the dairy districts becomes greater from year to year, and this difficulty renders stock raising desirable, at least with those who are trying to excel in quantity of dairy products. Why, then, should not the raising of dairy stock on dairy farms be the rule rather than the exception? The main reason is because it is supposed to cost more to raise a cow than it does to purchase one in the market; but granting this to be true, when we come to strike the difference between the good cows raised by judicious breeding and the poor ones bought from droves, it will be found far more profitable for dairymen to raise and educate the animals on the farm, under their own immediate supervision, than to depend on purchasing.

Grade cattle from good milking families of Short-Horns are, on account of size, regarded with favor by many. When failing in milk, they take on flesh rapidly and can be turned to good account for beef. A cross of Short-Horn grades with Ayrshires is also held in high esteem by some as productive of all the milking qualities of the Ayrshire, with an improvement in size from the Short-Horn. The principle of like producing like will generally hold good in breeding for the dairy. Hence great attention should be had to breed from good milking families, and the parents on both sides should be from stock noted in this respect.

As the production of milk in large quantities is more or less exhausting, sound constitution and health are points to be considered. An old and feeble cow will not be as likely to breed as vigorous stock as younger animals in high health. Mr. FINLEY DUNN, in a prize essay on the Hereditary Diseases of Cattle, published in the Journal of the Royal Agricultural Society of England, enumerates diarrhea, rheumatism, scrofula, consumption, dysentery, malignant tumors and affections depending on a plethoric state of the body, as the most important hereditary diseases of cattle. Among others, he gives the following characteristics which cattle should possess, in order to perpetuate in their offspring a healthy and vigorous constitution, viz.:

"The head small; muzzle fine and tapering; nostrils large and open; the eyes full and lustrous; the ears small and not too thick; the head well set on the neck; the distance between the ears and the angle of the jaw short, but the width behind the ears considerable (no dairy cow should have a short, thick neck); the chest wide and deep; the girth, taken immediately behind the shoulder, should correspond with the length from behind the ears to the rise of the tail; the carcass of a barrel shape, for a thin, flat-ribbed animal eats largely, thrives badly, and is usually liable to diarrhea; there should be but little space between the prominence of the hip and the last rib; the quarter large; the measurement from the prominence of the haunch backward to the rise of the tail and downward to the hock as great as possible; the lower part of the haunch thick and broad; the hide thick and pliant; smallness of bone is a sure indication of early maturity and aptitude for fattening."

These, among other characteristics and qualities enumerated by Mr DUNN, indicate the possession of a vigorous and healthy constitution and freedom from all inherent disease. In raising stock for the dairy, it must be remembered that the calf should have generous feed and good care and treatment in every respect, for a scrubby, dwarfed and pinched calf cannot be expected to mature into the best cow. Care must be taken also that it be not overfed, so as to become dainty, but kept in a healthy, growing condition.

Extra feed should be given when grass is scant and of poor quality. Roots, oatmeal and the best of early-cut hay, fed regularly during winter, with well-lighted and well-ventilated stables—all will amply repay the breeder, in the better size, condition and prospective value of the animal for the dairy.

The education of the animal for the dairy is also of prime importance. Docility, good temper, quietness, all of which are necessary in a good milch cow, are the result, in a great measure, of kind treatment and early education. Many a fine animal has been irreparably ruined by coarse and brutal treatment, for no cow that trembles from fright or exhibits great nervousness during milking will yield her greatest capacity of milk.

Calves, from the first, should be fondled and made familiar with persons; never frightened or worried by dogs, beaten or cruelly treated; they should have no fear of their attendants, but rather express pleasure in their presence and a willingness to be petted and handled; and when the heifer "comes in milk" the utmost kindness and tenderness should be shown in her management until the animal is thoroughly broken and shows no more nervousness at being milked than in the suckling of her own calf. Heifers that have been well kept will begin to come in milk at two years of age, and are regarded as making better cows than when coming in milk at a later age, since the capacity for giving milk is varied by habit, and an early development in this regard stimulates secretion of milk and, as found by experience, is productive of better results.

We have enumerated some of the leading points to be observed in raising stock for the dairy, and we urge the question upon the attention of dairymen at this time because they have now leisure to think the matter over and lay out plans for the future. Superior cows are not unfrequently raised by selecting calves from deep-milking natives which cannot boast of "royal blood" in their veins, and we should not hesitate to raise stock from such animals in case no provision has been made to cross with thoroughbreds. We should be glad to see more interest taken by dairymen in breeding stock for the dairy. We ought to get better returns, both of cheese and butter, than we do, and this object can never be successfully accomplished unless dairymen go back to the beginning and breed their own stock. We need cows that will turn off 600 pounds of cheese annually, or from 250 to 300 pounds of butter. This product cannot be obtained from the culls picked out of droves. If we are to reap a good profit from dairying and make it a grand success, it must come from having deep milkers, and the surest way to secure these is by judicious breeding upon the farm where they are to be used.

DRYING OFF THE COWS.

THE season has now come when the herds are to be dried of their milk, and it is one of the most important operations connected with the successful management of the dairy. Immense losses are sustained annually from an improper manner of drying off cows. If milk is allowed to remain in the udder even in very small quantities, it becomes thick and coagulated and acts as a foreign substance, producing irritation, and is liable to affect injuriously or destroy some of the parts of the bag and teats. The whole structure of the udder is a complicated and delicate affair. The arteries going to the udder are both large and numerous, and the branches of each vessel freely anastomose together, so that no interruption to the regularity of the supply of blood to every part of the gland may take place. The several vessels which come off from these arteries penetrate into the substance of the mamma, within which they freely ramify by numerous divisions and sub-divisions. Ultimately, by further splitting up and consequent diminution of their caliber, they form vessels so minute as to be unobservable to the naked eye, and which have been designated capillaries. They are distributed to the follicles or cœcal extremities of the lactiferous ducts, upon which they form a minute *rete* of vessels, and furnish blood, both in a sufficient quantity and also in a condition fitted for the secretion of milk. From the cœcal extremities the milk, as it is formed, finds its way along the minute excretory ducts to which they are attached into large tubes, and thence into various-sized cavities, which are termed reservoirs. The arrangement of this portion of the gland may be compared to bunches of currants as connected with or growing upon their foot stalks. The fruit would here represent the milk-secreting follicles, and the stalks the tubes by which it is conveyed away.

It will be seen from the above that a structure so complicated and delicate is liable to become deranged in some of its parts by improper usage, and that it cannot well maintain its integrity when milk is allowed to accumulate and remain to decompose and become rotten, as it often does when there has been neglect in properly "drying off" the animal. When cows begin to fail in their milk, the supply of blood to the glands becomes less, and when milk is left in the udder a portion of it will be absorbed in the system, Nature taking this way to rid the glands of a substance which requires to be removed. But when the milk coagulates, the caseinous portions become hard and remain. Thus, when the cow again comes in milk, we find this foreign substance acting as an irritant, inducing, not unfrequently, violent inflammation, and we have "swelled bag," garget, or some disease of the udder which causes trouble. Often particles of coagulated milk fill up the milk duct at the base of the teat or lower down, causing a stoppage of milk through the duct, and hence spoiling the teat for further use. Of late years a large number of cows throughout the dairy districts are found which have lost the use of one or more teats, and they are generally among the best cows of the herd. The cause is largely owing to neglect in properly "drying off."

Cows cannot be dried of their milk at once, and some cows continue to secrete milk in small quantities for a long time. But in all cases where the animal has ceased to give milk, or is what is termed "dry," she should have her udder examined from time to time and the teats tried to see if any milk can be drawn. At first the trial should be made at intervals of two or three days, and if there is a particle of milk in the bag it should be all thoroughly drawn. Then the trial may be made at longer intervals. When cows are supposed to be completely dry, the rule should be to go through the herd every week, making trial of the teats to see if any milk can be drawn. And this work cannot safely be intrusted to "hired help," but must be performed under the "eye of master." Many persons are not aware of the importance of drying cows, and hired help often think it a piece of folly to try to draw milk from a dry cow. We have had such men, and they were good, honest men, too, and they would insist that certain cows were perfectly dry, but yet, when put to the test under our rule of trying the teats once a week during winter, we have found, in numerous instances, that small quantities of thick milk or a watery fluid could be drawn from the udder.

We have lost the use of valuable cows by intrusting this work to persons in our employ, and there is scarcely a dairyman in New York who cannot trace trouble in his herd to either his own neglect or that of others. Indeed, so large is the loss every year from improperly drying cows that there is scarcely a subject connected with dairy management of more vital importance than this. We urge it, therefore, upon the attention of dairymen, and we say to them: Be sure that the work is done properly—trust no eye but your own, and when your herd comes in milk next spring you will realize the value of our advice.

ILLINOIS STATE DAIRYMEN'S ASSOCIATION.

THE Illinois Dairymen hold their Annual Convention at Elgin, Ill., commencing Dec. 12, at 10 A. M. The Executive Committee of the State Association have marked out quite an elaborate programme for the occasion. It is as follows:

Address of welcome by the President: the supply and demand of dairy products and their future markets—Hon. S. Wilcox, Elgin; C. H. Wilder, Wisconsin; H. W. Mead, Hebron. The best plan to avoid the low prices which usually prevail for butter and cheese during the summer months—R. R. Stone, Elgin; R. W. Stewart, Hebron. Manure, how to care for and apply—Jno. Keating, Elgin; C. H. Larkin, Elgin. The best method of improving and supplying the dairy; different breeds and their adaptation to our climate—D. Levery, Leland; Hon. William Patten, Sandwich; Geo. E. Brown, Elgin. The manufacture of skimmed milk; is it injurious or beneficial to the dairy interest?—Hon. S. Wilcox, Elgin; D. E. Wood, Huntley; A. H. Barber, Chicago. Marketing dairy products—J. R. McLean, Elgin; Wm. H. Stewart, Woodstock. The best and cheapest feed to keep up the supply of milk during the summer drought—S. W. Kingsley, Barrington; Thomas Bishop, Elgin. Grasses, the best varieties for hay and pasture, as adapted to our climate and soils—W. J. Burdick, Whitewater, Wis.; C. C. Buell, Rock Falls; S. Wilcox, Elgin. How shall we improve the dairy interest of Illinois?—I. Boies, Byron; C. C. Buell, Rock Falls; G. P. Lord, Elgin; R. R. Stone, Elgin. What are the essential requirements of a good dairy farm?—R. W. Stewart, Hebron; C. C. Buell, Rock Falls; M. H. Thompson, Elgin. What is the best and most economical mode of handling milk to make butter from small dairies of 5 to 25 cows?—C. Gilbert, Marengo; S. K. Bartholomew, Marengo; Hon. S. Wilcox, Elgin. To what extent may soiling be profitably substituted for pasturage?—D. C. Scofield, Elgin; W. D. Henning, Plano. Can summer butter be so handled and packed that it will retain its sweetness for winter use:—N. Eldred, Gelman; C. C. Buell, Rock Falls; L. Boies, Marengo. Can the dairyman of Illinois profitably raise calves to supply the dairy?—I. H. Wanzer, Elgin; Wm. Boies, Byron; E. W. Stewart, Marengo.

A discussion will be had upon the question, "Has the display of dairy products at the American Centennial been of benefit to the dairy interest at large?"

Illinois, we believe, made no display of dairy products at the Centennial. The Illinois dairymen, it will be remembered, protested against the appointment of Prof. ARNOLD as Juror of Dairy Products, which protest Mr. SCOVILLE retained in his pocket and did not forward to the Commission. As the Ring management of the dairy display at the Centennial has resulted in a complete failure and laughing-stock, we presume the discussion will bring out the whole matter for the edification of Western men. The Illinois State Dairymen's Association is a live Society, and the meeting will be one of great interest.

THE DAIRY RING IN A NEW ROLE.

AN esteemed correspondent sends us the following:

"It is well known that soon after the great *fiasco* of the half-dozen members of the Centennial Dairy Committee at Utica, when Mr. BLISS began to protest against their illicit action, Mr. D. L. POPE of Ohio was appointed a member of the Committee by Mr. SCOVILLE, and not by the Committee, who alone had authority to make such appointment, with the evident purpose of making him useful in their efforts to get rid of Mr. BLISS and install themselves in all the offices. At the next meeting of the Committee, the 'Executive Committee' was instituted and constituted, with Mr. POPE as Chairman. He (Mr. POPE) proved an exceedingly useful accession to the Ring for a time; but when his day of usefulness was past, with characteristic disregard of all else but their selfish and nefarious purposes to run the whole thing in their own individual interests, regardless of the rights of everybody else, they, in turn, went to work to get rid of him. He had become thoroughly disgusted with them and would gladly have stepped down and out were it not that he had been so unwise as to put some of his own funds into the payment of bills for the transportation of the apparatus and fixtures for the Dairy Building, and, as in the case of Mr. BLISS, the Committee peremptorily and positively refused to audit or pay his bills.

"Fortunately for Mr. POPE, Col. SPRAGUE of Vermont, who had donated to the Committee a full set of the famous Howe Scales, had exhibited them in his own name, and it so appeared on the books of the Commission. The Ring were greatly excited when they learned that the order of Col. SPRAGUE was necessary before they could get possession of the scales, and that he considered himself in honor bound to withhold the order until they had paid Mr. POPE the amount which he had advanced on account of their transportation.

Col. SPRAGUE is a member of the Vermont Legislature, now in session at Montpelier, and it became necessary for the Ring, in their haste to get hold of the spoils, to open a running correspondence by mail and telegraph with him. Mr. BLISS and two or three others of the Vermont victims of the Ring management are also in attendance upon the Legislature, and for several days their interest was about evenly divided between the dispatches in relation to the Presidential election and those that Col. SPRAGUE was receiving from the Ring managers. At last accounts Mr. POPE had got possession of all the scales but one."

What with quarreling among themselves and the failure of the Dairy Exhibition, the Ring are having a gay time.

EFFECTS OF POTATOES ON MILK.

THERE will probably be very few potatoes fed to cows this winter, but farmers having those which are too small for other purposes and desiring to feed them to stock will be interested in the following from the National Live Stock Journal:

We do not think the partial experiments upon this matter are properly interpreted, even by those who have made them. It has been found that a large feed of potatoes lessens the percentage of hay digested; but we think the large amount of starch contained in the potato causes a looseness of the bowels, and thus impairs the digestive function. We have often fed potatoes to cows in milk with great benefit. Our plan has been to run potatoes through a root-slicer, and feed four quarts at a time, mixed with cut hay and a pint of oil-meal or pea-meal, or a quart of oats. And since the experiments mentioned, we have again tried this mode of feeding and found it to work admirably well. The potato is a very imperfect food alone, being principally starch, having too little nitrogen and phosphate of lime to make milk; but it is the richest root raised on the farm, and when fed in small quantity, raw, will regulate the bowels and have a very similar effect to green grass. It is a very laxative food in the raw state, and that is, probably, the cause of its peculiar effect upon the digestion of hay.

When the potato is cooked the effect is quite different and its value is greatly increased. A

small quantity of potatoes, say four quarts as a feed, will increase the yield of milk nearly as much as so much grain, provided they are fed with other food rich in the constituents of milk. The American dairyman is prone to feed one thing at a time, almost wholly, instead of giving variety in food which will furnish all the elements required in the proper proportion. We found an objection to the use of oil-meal when fed above two pounds per day to a cow, as it is too laxative. We found one quart per day the most profitable, and have also found one peck of potatoes per day, in two feeds, the most profitable.

SWINDLERS OF DAIRYMEN.

We find the following going the rounds of the press without credit to the author, but as it may be the means of saving some of our readers from being swindled we publish the story as it is told:

A new dodge for swindling farmers has just been put into operation. Several strange men drive into an agricultural district; they stop at all the farm houses and make a contract to take all the butter the farmers can furnish at 50 cents a pound. Further, it will be gathered up by a fast, special team, and the cash paid for it at the door. The pretence is that during the fall and winter the large cities will be crowded and that butter will be scarce. In this way all the farmers in a district are contracted with, and arrangements are made to come for the butter on certain days and at certain points, the contract to go into effect in two weeks.

A few days after the departure of the men a drove of cows comes along; they are fine-looking milch cows. The farmers, having a good thing in view, think they might use a few more cows. They try to buy them, but the drover doesn't seem anxious to sell. Finally, however, he is induced to sell two or three to each farmer, at prices considerably higher than the real market value. He then departs, meets his partners who put up the butter job, and they divide their rascally-earned profits. Forewarned is forearmed, and farmers will do well to be on their guard against this new style of sharpers.

Sheep Husbandry.

MORE SHEEP WANTED.

A few weeks since a very convincing article was written to this effect and one would think farmers would see that when a country like the United States imports $50,000,000 worth of woolen goods and $11,000,000 worth of wool there must be something altogether wrong in sheep husbandry, here especially, when England, overrun with cattle and dairying, breeding immense numbers of pleasure horses for the chase and the turf, and with mankind swarming to that degree as to require millions upon millions' worth of vegetables, can yet breed more sheep on her area, garden-like in comparison with the States, than the whole of this country. Yet not only does she do so in numbers but each average animal sells for more than treble the price obtained here, and the washed wool brings fourfold the price of the fleeces here even with protection added. Now there is no protection there and nothing can show the folly of any interference with free commerce better than this, for here are farmers whining about 40 cents for wool when 25 cents will always pay for growing it with proper management.

Here in New York City and other cities are men looking for safe investments, yet these cannot see the immense fortunes which await the men who will form companies and go into sheep raising with the same spirit and business tact that are displayed in mercantile pursuits, and the few young men who go forth with their little alls, do not realize that in following the advice of the Western men, who talk as if nobody knew aught but themselves, they are permitting the blind to lead the blind, for why have not these men met the exigencies of the country by growing enough for home manufacture and exportation instead of sending away the heart's blood of the soil in exporting wheat and corn.

Men cannot use their faculties aright when they grow cotton at a loss buying artificial manure, when with their mild winters they could keep sheep at half the cost entailed in the North, and with the example of Australia before them too, the inhabitants of which country, though on the opposite side of the world and so far from market that they can make little of mutton, yet export more wool than the Americans grow, and thus bring gold in abundance, adding riches every year to their pockets, while the sheep give rich fertility to their soil instead of the owners despoiling it by plowing continually till they have sucked out every atom of the original maiden purity of newness.

There never was anything to equal the present state of agriculture in the United States and in Canada, for the experience of seeing the run-down, poverty-stricken fields in the East, does'nt stop the pitiable despoliation out West.

SHEEP HUSBANDRY AT THE SOUTH.

How far does the climate of the cotton States resemble that of Australia? Sheep do well there. Again why cannot wool be grown instead of cotton. I was in the South and in the S. W. some years since and saw that sheep did well, consequently as the land is very cheap and runs to grass readily, and everybody knows that grazing with sheep rapidly improves the pastures, why does'nt sheep-raising become a great source of wealth?

I expect the cause for such unaccountable neglect must be the failure of some few young men who have gone out and lost money, but this only proves that the system as at present in vogue is altogether wrong.

Some years ago I was about to engage in this enterprise with one of the Lelands but would not do so because of being obliged if I did to follow in the steps of those who were only crawling along in the old track; then I corresponded with a banker of Cazinovia who had a dairy and sheep establishment in Iowa, but he refused to comply with my first proposition to raise calves, using pure bred bulls, and then he consulted with some friends about my next proposal to kill off or sell all the old wether sheep, (over a thousand) putting ewes in their places and using Cotswold rams, then he intimated I knew so little about the West that I had no chance with him. I respectfully replied he would find these miserable men would lead him on to great losses, and two years after, I heard his flock could not be kept up in numbers without purchases, although he made no sales of aught but wool, and that it took all the profits of the dairy to buy fresh cows, and the next news was seeing the whole concern offered for sale in an advertisement.

It is useless to mince words about sheep-raising, wool-growing, or management of flocks in the United States, for facts speak for themselves and as long as farmers sell ewe lambs and use scrub rams, and keep wethers till past their prime, there will be no fortunes made by sheep husbandry.

Sheep are easily kept healthy, and if managed systematically will return more profit than can be made from any other animals, and where they are well taken care of, in the way of keeping the young and old separate, and never allowed to pine or suffer in any way, they are certain to bring in a handsome income and the land will improve in proportion to the prosperous state of the sheep, and the higher condition of the sheep will produce a similar increase in the fatness of the soil.

Thus in England the farmer who occupies much arable land and feeds his sheep on the English modern system, by keeping all the lambs in high condition and the wether ones very fat from their birth, will have a great income from mutton, from wool and also from the increased quantity of grain, straw, grass, &c. Sheep thus give three sources of income annually.

Working Farmer.

The Horseman.

CLIPPING HORSES.

I believe that it is a well established fact, that editors know everything, and therefore I confidently appeal to you for information. It is said by some (who have no ax to grind) that clipped horses will keep on one half the food that those not clipped require. Now, sir, will you be kind enough to inform me if such is the case? Don't forget that you, by virtue of your profession, know everything. Another thing I should like to be informed on:—How is it known that only half rations are required for such a horse? Perhaps I am unreasonable, but a mere *ipse dixit* is scarcely sufficient for me. If one has measured the feed before clipping and since, and he really finds that his horse eats only two quarts while he ate four quarts in his normal condition, and is as fat and strong now as then, I say he knows whereof he speaks. Now there is a very considerable difference between two and four when you come down to realities; but when one guesses, as is frequently the case, there is but a *slight* difference.

I have, in some things, quite an economical turn of mind, especially so in the matter of horse feed. I believe that a horse in his natural condition is very nearly, if not quite right; but am willing to learn if he can be improved on—I mean in the matter of clothing. I notice that although the advocates of clipping claim that a horse does not sweat so easily and, of course, cannot get hot so quickly, still they are very careful when they stop to put on two blankets and a buffalo robe over their steeds.

Even if it is conceded that there is a propriety in clipping, will it do in all cases? Where a horse is sometimes called upon to do farm work and at other times is driven on the road before a light vehicle, is it advisable to clip? When a horse is used for nothing but work, would you clip him? How soon after a hard drive can a clipped one be fed? It is claimed that he will cool off enough in ten minutes to be fed. If that is so, it is an important consideration—or rather argument—in favor of clipping. I have found that it takes a long time sometimes for an unclipped horse to cool off. I have been told that it is always safe to feed one hour after being driven. Is that so? H. Z.

Our correspondent has certainly presumed too much upon the knowledge of editors, for there are some things which are past finding out. Had you asked us to decide the question whether this earth was hollow or filled with sawdust, it would have been much easier to have answered it correctly than the one you have propounded about clipping horses.

If the "clipperites" would only discover some way of driving in the hairs on a horse instead of cutting them off, then we could understand how there might be a saving of food equal to the amount required to produce the extra length of hair; but how to save by cutting off and wasting, is a problem not solved in our philosophy.

If cutting off the hair short is such a saving, why not shave it off close, and then who knows but taking off the skin would be still better? Of course there are horsemen who will find plenty of very plausible theories to employ in support of clipping, just as their cruel predecessors did for pricking and docking the tails of horses years ago; but the saving of feed by lessening the length of the hair on an animal, is something in the way of a discovery worthy of the bright minds of the nineteenth century. Never having thought it worthy of our time to test the clipping theory, we must plead ignorance and, further, fear we shall be no better off years hence than now, owing to our faith in Divine wisdom in giving the noble horse a good coat of hair to protect him from the elements.

The Apiarian.

DO BEES MAKE HONEY?

I do not know why there should be any mystery about this question of bees making or gathering honey, for, to me, it is as clear as sunshine.

Suppose we take the best sugar and make a gallon of molasses and sirup and put it where the bees can get it, and they take it into the hives, and in time cap it over in the cell, but, in the meantime, let us keep a little sirup for comparison. After awhile, take an extractor and remove the sirup from the comb, and it will be found to be honey and quite different from the reserved material—in fact, one is honey and the other is not. The bees, of course, did not make the honey, but changed the flavor only.

It will not be clover honey, linden or buckwheat honey, but sirup honey. Their Creator has given the bees the power of changing the flavor of the sweets gathered, and it is then called by us honey. We may say that bees made it, and so we may say that cloth made of wool is woolen; and of flax, linen; of cotton, cotton cloth, and so with honey. If from buckwheat, it is buckwheat honey, for the bees cannot change it into clover honey any more than we can make cotton cloth out of wool.

Onondaga Co., N. Y. A. Wilson.

BEES IN WINTER.

The Essay on Bee-Keeping receiving the prize offered by the Centennial committee of the North Eastern Bee Keepers' Association was written by Prof. A. J. Cook, of Michigan. Not having room for the entire essay we copy that portion relating to wintering Bees.

What are the requisites to safe wintering? 1. The colonies must be kept in a uniform temperature, which should never vary beyond the minimum temperature of 35 or the maximum of 45 deg. This may be safely secured by placing them in a dry, dark, well-ventilated cellar, which shall maintain the required temperature; or in a house with double walls, enclosing a space wide enough when filled in with sawdust to be frost proof, even during the severest winter, and so arranged as to be ventilated without admitting the light. The same results may be gained with the colonies on their summer stands, if we but place boxes or boards around and above the hives, leaving a space of a foot or more to be filled in with sawdust, chaff, straw, or shavings, all of which I have used with perfect success. In this case it may be well to use a tube or portico to the hive so that the bees may fly out should the weather be warm for so long a time that the bees would become overheated and uneasy. The same object may be gained by leaving the front of the hive, which should face to the east, unprotected. Could we be sure of sufficient snow so that our bees could be covered deeply the winter through, we could ask for nothing better. I never had my bees do better than when thus protected, during the disastrous winter of '72—3 when my bees, and those of a neighbor which I arranged, were all that survived in the whole neighborhood.

2. The bees should not go into winter quarters without at least 30 lbs. of good capped honey. If the combs contain uncapped honey it should be extracted. If the apiarist has not the requisite amount of suitable honey it will do equally well to supplement his supply by feeding good, thick honey which has been extracted early in the season, or if that be not at his command a sirup made of coffee. A sugar of the consistency of honey, or just so that it will not crystalize upon cooling, will answer equally well. Perhaps the most convenient method to feed this is to put it in a bag made of drilling which is tacked to a strip of wood just like the top bar of a frame, except that it is two inches wide and has a hole cut in the center 1 inch wide and 2 inches long. Hang this between the frames and the end of the hive, then pour in the honey or syrup. The bees will sip it up and store it away as it oozes through the feeder. Of course the bag should not reach quite to the bottom or sides of the hive. The feeding should be done as early as the last of September, so that the bees may have time to cap the cells before the weather is too cold.

3. Any impotent queens or any not first-class, should be superseded early in the season. If the bees stop gathering in August, feed sparingly, as described above. One-half pound daily will suffice. Again if storing be very rapid in August and September, as it is likely to be where fall bloom is plenty, the honey must be extracted, so that the queen may have a chance to deposit eggs. Brood rearing would have entirely ceased in all my colonies the present season as early as August had I omitted to extract. As it is there is brood in nearly all of them to-day—October 18th. Those apiarists about here who have not extracted may look for spring dwindling the coming spring.

4. Immediately above the bees there should be placed a quilt made of good factory, and still above this if the hives permit as in most cases they will, there should be placed a factory bag filled loosely with chaff. This may be from 6 to 12 inches in thickness.

So sure am I that the above methods will succeed without fail, that I sell my bees in autumn, warranting them to winter if I can oversee the preparation.

MELIPONES.

Few of our readers probably ever heard of an insect by the above name, but the London Gardeners' Chronicle tells us that the hymenopterous insects known as Melipones, and found in various parts of the world, resemble bees very closely, but are without any sting. Their honey-producing qualities are very decided. Resembling bees in their general character, they are smaller, with a more densely clothed body and the hind feet proportionally longer. As in the ordinary bees, there are three varieties of individuals—the males, females, and neuters. Some of them make their nests in hollow trees, while others suspend them from the branches. The honey of these insects is said to be of a very superior quality.

It is a common practice among the people in this locality when stung by a bee to extract the sting at once and immedialy after this is done cover the punctured part with the pipe of a watch key, pressing it firmly on for some time, and when removed a little honey is rubbed over the wound.

ITALIAN BEES.

Prof. H. J. Cook, in speaking of the races of bees in his "Manual of the Apiary," says of these bees: They take their name from the fact that they were first discovered in the mountain basin of northern Italy and Switzerland, shut in, as it were, by the Alps. Without much doubt they are a climatic variety, with characters of coloration and habits so inbred that they are a fixed race. It may be, as has been asserted, that the original stock was a cross between the black and the Egyptian races. The queen varies much in color. She may be almost entirely yellow, is rarely almost as black as the German queen, but is generally irregularly marked with black and yellow. The drones are also black, annulated, or spotted with yellow, while the neuters will, without exception, if the stock is pure, possess three yellow bands about the base of the abdomen. I repeat, every bee in the colony must be thus marked. The first ring is close to the thorax, and very narrow. The second is quite broad. These two rings are usually quite distinct in hybrids. The third ring is narrower, and may be obscured in old bees, especially if not distended with honey. When this ring is absent in any of the bees, there is "something rotten in Denmark."

Scientific and Useful.

SOMETHING ABOUT STEAM-POWER.—No. 1.

While the historical critics of the day are industriously robbing antiquity of the interest attached to legends of heroism, prodigy and sentiment, dear to the credulous hearts of our forefathers; writers of another class are equally zealous in gifting those remote ages, with a barren knowledge of most of the inventions and discoveries commonly eulogized as exclusively modern. Even if we credit the researches of these praisers of the past, however, surprise that the ancients should have possessed an inkling of so many recent arts and revelations is lost in astonishment at their lack of ingenuity to turn their meagre information to any practical use or benefit.

Among the latter-day discoveries with which they are credited is an acquaintance with steam as a motive power, and in support of this assertion reference is made to a few insignificant contrivances, imperfectly described by a brace of obscure authors, as intended for amusement or deception. It was only in our great grandfathers' days however, that this power was rediscovered and utilized, and a large share of the mechanical and scientific skill of the last three or four generations has been busily engaged in perfecting machinery for its employment and in studying its properties and capacity.

According to the latest scientific revelations steam is the vapor of water, or water converted by heat into a non-permanent gas. This gas is perfectly colorless and transparent, and therefore invisible, and it is only when a part of it has become condensed into a mist or cloud that it is seen.

The gasification of water takes place even at low temperatures, as the surface continually gives off vapor which mingles readily with the air. The tension or expansive force of this, however, is low, but it increases with increased temperature until the boiling point is reached, when it is equal to the pressure of the atmosphere, which is forced aside and the steam escapes in a body. At this temperature steam is formed rapidly within the mass as well as at the surface, and ebullition is caused by the efforts of this internal vapor to escape.

The temperature of the boiling point varies with the purity of the water and the pressure upon it. With water perfectly pure, at the sea level, and under atmospheric pressure only, ebullition takes place at a temperature of 212°. With sea water, at the bottom of a deep mine, or under artificial pressure a higher temperature is needed, while at an accessible mountain elevation, or when placed in a receiver from which the air has been partly exhausted, and atmospheric pressure thus reduced, water boils at a temperature so low that neither eggs nor meat can be cooked by it. The temperature of boiling water is constant under a constant pressure and can only be increased by increasing the pressure upon it, as any additional heat applied to it is employed in converting the liquid into vapor with greater rapidity.

To effect this vaporization from water at a temperature of 212°, into steam at the same temperature about 5½ times as much heat is required as to raise the same weight of water from the freezing to the boiling point. This heat received constantly from the fire, after the water has attained the temperature of 212°, was supposed to combine with the water and steam without raising the temperature of either, and has therefore been called latent heat, in contradistinction to the heat used in heating water to the boiling point which has been styled sensible heat. The bulk of this latent heat, however, is expended in overcoming the cohesion of the liquid, and a part in forcing aside the incumbent atmosphere so as to make room for the steam, and only a small fraction of it performs any of the work of steam.

By confining the vapor, its pressure upon the water is increased, so that the boiling point is raised, and with it the temperature and tension of the pent-up steam are both augmented. The density, temperature, and pressure of steam always bear a uniform relation to each other, and any change in one of these particulars necessarily entails a corresponding change in the other two. At 212° steam is a trifle over one-half the weight of air, and is about 1700 times the bulk of the water from which it was formed, so that a cubic inch of water is transmuted into nearly a cubic foot of steam. It then has a pressure of one atmosphere, or 15 lbs. to the square inch. This pressure or tension is doubled at a temperature of 250° and by increasing the temperature, which can be done only by checking the outrush of steam and so augmenting its pressure on the water at the same time that a sufficiency of heat is applied to it, the expansive force of the confined steam is only limited by the tenacity of the vessel that contains it. This enormous expansibility of steam coupled with its capacity of extremely rapid condensation is the source of all steam power.

TEA CULTURE IN CHINA.

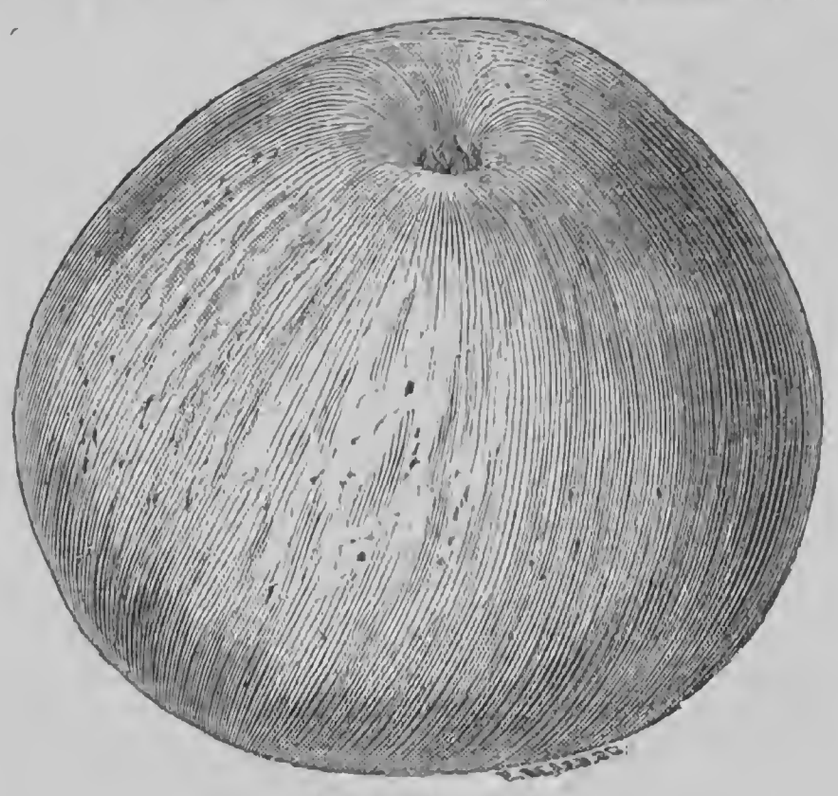
Any information about an article so extensively used as tea is always more or less interesting. Hundreds of different stories have been told about the method of gathering and preparing tea for market, the greater part of which were long since proved to be erroneous, but since the introduction of steamboats and railroads, hundreds of persons have visited the home of the tea-plant, where one did before the introduction of such facilities for rapid transit, consequently the great mysteries about tea culture have passed away. Mr. F. B. Thurber of this city now in China writes to the American Grocer a long and interesting letter on gathering and preparing teas for market from which we copy the following:

The methods followed in cultivating tea in China are almost precisely similar to those pursued in Japan, a detailed account of which I sent you a short time since. There is some difference, however, in the mode of preparation, and indeed, this varies considerably in China in different districts, which produce different kinds of tea. The leaf, however, is essentially the same all over China, and all the different varieties of black and green are produced by a difference in the curing and manipulation. In certain districts, however, they are more in the habit of producing certain varieties, unless the market should so shape that some other variety commands a better price; in which case, it will change from green to black or black to green. The great tea producing sections are in the middle of China, and more largely in the sections tributary to the Yang-tse-Kiang River than any other. It is mostly grown by small proprietors or farmers, who cure it sufficiently to transport it to the native dealers, who collect and ship it to the treaty ports, where it is again sold to the large dealers, who refire it, assort it into grades, and, in turn, sell it to the foreign merchants, who export it to the different parts of the world.

When it is first picked, if destined for green teas, it is thinly spread upon bamboo trays and exposed to the sun for an hour or two, then thrown into firing-pans and rapidly moved about for, perhaps, five minutes. The heat develops the moisture and thoroughly wilts the leaves, which are then drawn quickly out and placed upon the rolling-tables They are then rolled with the hands (and sometimes with the feet) in such a way as to produce the style of tea most desired—a more circular motion being necessary for "Gunpowders" and "Imperials" than for "Young Hysons" and "Hysons." It is then replaced in the firing pans and kept moving by the rapid motion of the hands of the workmen for a length of time, varying somewhat with the degree of heat, but usually for an hour and a half or two hours. The leaves are then quite well dried and their color fixed, and it may now be said to be a natural-colored green tea.

After it gets into the hands of the large native merchants at the shipping ports, however, it is refired, and during this process a little coloring matter is added—principally gypsum and indigo—in order to give it the handsome, glossy "face," such as is popular in the American market. With black teas the treatment is entirely different, the leaves being simply dried by the producer, during which process it is slightly rolled, and it remains in this condition until it reaches the hands of the wholesale merchant, who refires it and manipulates it in such a way as to materially change the flavor. Indeed, it may be said this manipulation at the tea-firing "go-downs" is the most important part of the process, as different flavors can be produced at will, and upon the assorting and sifting depends the fineness of each grade.

In some sections, during this manipulation by the large dealers, artificially-flavored teas are produced. In Canton we saw a large quantity of tea of ordinary quality being scented by flowers gathered from a variety of jasmine, which produces a white, deliciously fragrant blossom. A layer of tea is placed in the bottom of a large basket and a few flowers scattered upon it, then another layer of tea and another layer of flowers, and so on, until the basket is full. The flowers are generally placed in the tea in the afternoon, and allowed to remain there over night, when it is found that the tea has absorbed most of the fragrance from the flowers, and is certainly very much improved. The flowers are then removed by sifting, and the tea refired to drive off the moisture that it may have gathered from the blossoms, and is then ready for packing. This is done both with black and green teas, but probably to a greater extent with the varieties known as "Scented Caper" and "Flowery Pekoe," which go mostly to England, where they are used for mixing purposes.



THE WEALTHY APPLE.

CHARCOAL FOR REMOVING HAIR.

The Panama Star reports what it calls a very important discovery that charcoal, animal or vegetable, is a better agent than lime for the removal of the hair from hides, preparatory to tanning. An exchange assures us that the depilation of hides with charcoal appears likely to supersede altogether the usual lime process. As is well known, charcoal has the property to take up large quantities of oxygen from the atmospheric air, and the oxygen in this form seems to exert a chemical influence on the fatty substance present in the neighborhood of the glands of the hair roots. An oxidation takes place in the pores of the skin, which destroys the glands and loosens the hair. Finely powdered charcoal is mixed with sufficient water to make a thin paste, and the hides immersed for four or five days and well turned.

Hides treated with charcoal require no other operation, as in the case of the lime process, and after being washed with water, they are ready for tanning. Animal or vegetable charcoal can be used in any quantity, having no deleterious property whatsoever. For each hide, six or ten pounds with necessary quantity of water are sufficient, and the temperature to be maintained is 61 or 70 degrees Fahr. This information may be of great value to the people in the interior of the State, who occupy themselves in the tanning of that common leather, known in America as *sucla*. There is always a great demand for this leather in the manufacture of saddles and accoutrements for the cattle-men and travelers, also for trunks, shoes, chair bottoms, and other articles of utility.

The demand is so great that the suelas have, most of them, to be brought from Guayaquil, Payta, and other foreign places, where it seems they can be prepared more cheaply than by our native workmen. By the use of charcoal, which is much cheaper and more readily obtained than lime, the tanners will be placed on a more advantageous footing for producing the suelas at a considerably less cost than hitherto. They will then be able to sell the article at a cheaper price and yet secure quite as much profit as before. It is a matter for surprise, that so remunerative a trade as the tanning of hides into leather has not yet become a leading industry in this State. Hides can be had in great abundance for this purpose, and the bark for the conversion of hides into leather, can be obtained all along the sea-shore, and of the best quality. The mangrove or mangle plant, the bark of which is thus used, is present everywhere on the coast.

Pomological.

THE WEALTHY APPLE.

This comparatively new apple, has become exceedingly popular in the Northwestern States during the past few years. It was first noticed in the Rural New-Yorker in 1869, an outline of a specimen of the fruit accompanying a brief description. Since that time this variety seems to have continually gained friends, and is now being extensively planted in the West. It originated near St. Paul, Minnesota, from seed brought from Maine, somewhere about the year 1860. The tree has proved to be very hardy and vigorous. The fruit is medium to large, the accompanying illustration may be considered to fairly represent an average of well-grown specimens. The form is a roundish oblate, the color, whitish-yellow ground, shaded with deep rich crimson in the sun, with obscure, broken stripes and mottling in the shade. Flesh, white fine grained, stained with red, tender, juicy, vinous subacid; season, December to February. A most excellent variety for cold Northern localities.

A NEW APPLE—COX'S RED-LEAF RUSSET.

Dr. Hogg who, as our readers well know, is a high English authority in Pomology, says of the above apple:—"Fruit round, inclining to oblate in appearance, very like Golden Knob, skin entirely covered with bright cinnamon-colored russet which is thinner on the shaded side where it exposes a little of the yellow ground. Eye set in a pretty wide and deep saucer-like basin, stalk, pretty stout, set in a round cavity. Flesh yellowish, tender, crisp, very juicy and sweet, with a rich flavor and pleasant aroma. An excellent dessert apple in use from December till February."

Mr. Cox, the raiser thus writes of it:—"It is ostensibly, according to my own manipulation, a cross between the Golden Knob and Golden Harvey; but there is a possibility that I was anticipated by the bees, as a tree of the Old Nonpareil grew near by; and I am the more convinced of this, because the fruit possesses three of the characteristics of the Old Nonpareil viz., shape, long stalk and tenderness. When in perfection, the flavor is most delicious and peculiar to itself; and it may be considered in perfection from February until the end of May after which, although keeping sound until the end of July, the flavor gradually deteriorates." It has received a first-class certificate from the Royal Hort. Society.

Wm. Paul & Son of London have the entire stock of this new apple, and we have given the above description in order that our nurserymen may determine whether it is worth their while or not to import it with a view of testing its merits in this country.

ORANGES IN CALIFORNIA.

Orange culture in some parts of California appears to have been so successful that hereafter this fruit may be considered one of the fixed and certain products of the State. The Pacific Rural Press says on this subject:

Dr. Strentzel, who is a pioneer in orange culture, has eighty acres in the choicest of fruits—oranges, lemons, pomegranates, cherries, prunes, plums, almonds, pears, peaches, quinces, apples and grapes. We saw oranges, lemons and pomegranates in all stages—from the blossom to ripe fruit on the same trees. The doctor has the osage orange growing thick and tall around his ranch, as a wind-break. His Centennial orange grove, of eight acres, set out this year, has blue gum planted around it as a wind-break. The proprietor gave us much valuable information on orange culture. We have space for some suggestions. They will need a protection of brush, old sacks, etc., for several years; should be made to branch at the ground to protect the stand from the sun; have abundance of water; plant close to shade the ground—say from fifteen to eighteen feet apart. Plants raised in the house never do any good in the open ground. Better plant the seed in open ground, water well, and protect with brush, etc. He says the cold of our winter nights does not hurt oranges; it is the morning's sun. He also says they have to protect oranges from the winter's sun in Italy. His fruit was delicious, oranges never better, his wife a charming lady, and his daughter a fine colloquist and floriculturist.

TAR ON FRUIT TREES.

According to the experience of Mr. Henry Reynolds of North Carolina as given in the Semi-Tropical, tar is a perfect remedy for scarred and sun-cracked apple trees. He says, that by coating with new tar the trunk of a favorite fruit-bearer that was cracked and so de-

cayed that the bark was dead and would peel off, he has restored it fully. He applies it to all branches that show signs of decay. Since practicing this cheap remedy, he has not been troubled with insects. By applying tar to the trunk, and clearing away the surface at the roots, so as to let it run down on them, peach trees badly damaged by borers are fully restored. Replace the dirt, and you will have no more trouble with the tree for two years or more. If the tar is applied to young trees, the borers will not trouble them at all. He states that the coating should be applied in the winter, or early in the spring, with new tar.

The Poultry Yard.

DESIGN FOR A POULTRY HOUSE AND PARK.

A short time ago there appeared a request in the Rural for a design for a small poultry house. I submit the following plan as being novel and pleasing in appearance, and, what is still better, containing, as I believe, good and practical features.

The drawing is simply a ground plan; the embellishments of the elevation being left to the taste or liberality of the builder. A, the house proper, is L-shaped in plan, the longer or outer sides being 12 feet in length and 8 feet high, the inner side being 6 feet high, the whole formed of boards, placed perpendicularly, and which should be well and neatly battened. The roof may be shingled. The width of the building is 4 feet. A partition, with door, divides the building at B when desired. Entrance doors are at C, C. The nests are placed at D, D, and should be near the ground.

The yard or park is semi-circular in form, and may be divided through the center, north and south, if two varieties of fowls are desired to be kept separate. At E is shown a small inclosure for sick fowls or for breeding purposes. Two windows are placed in each of the inner sides of the house, affording plenty of light and warmth from the sun. Communication by the fowls between the house and park is attained by openings between the windows and near the ground. These should be provided with doors. F, F, are the roosts, three or four feet from the ground.

An important element of this design is in the combined *shape* and *position* of the building. It should be placed, as indicated by the points of the compass, with the apex C, C, towards the north. Then the inner angles of the building will afford shelter from east, north and west winds, and give the fowls a constantly sunny aspect during the whole of the short winter days.

Phelps, N. Y. Wm. R. Brooks.

THE AFFECTIONS OF FOWLS.

Noticing an article in one of your late numbers on fowl affection; I venture to send you an instance that came under my observation.

I once set some geese eggs under a hen, which in time resulted in four goslings. As usual in such cases, Biddy didn't seem quite pleased or satisfied with their strange ways, but showed no real annoyance, until her earlier bed-time came, and they refused to follow her to the coop, running about to pick grass or sitting down in cunning obstinacy. After enduring such conduct for just four weeks, her forbearance gave way and one night she left them and went back to her old companions on the hen roost. Next morning I found her by the coop, where I had put them, waiting for them to be let out to resume her care through the day. This was kept up until she weaned them late in the summer.

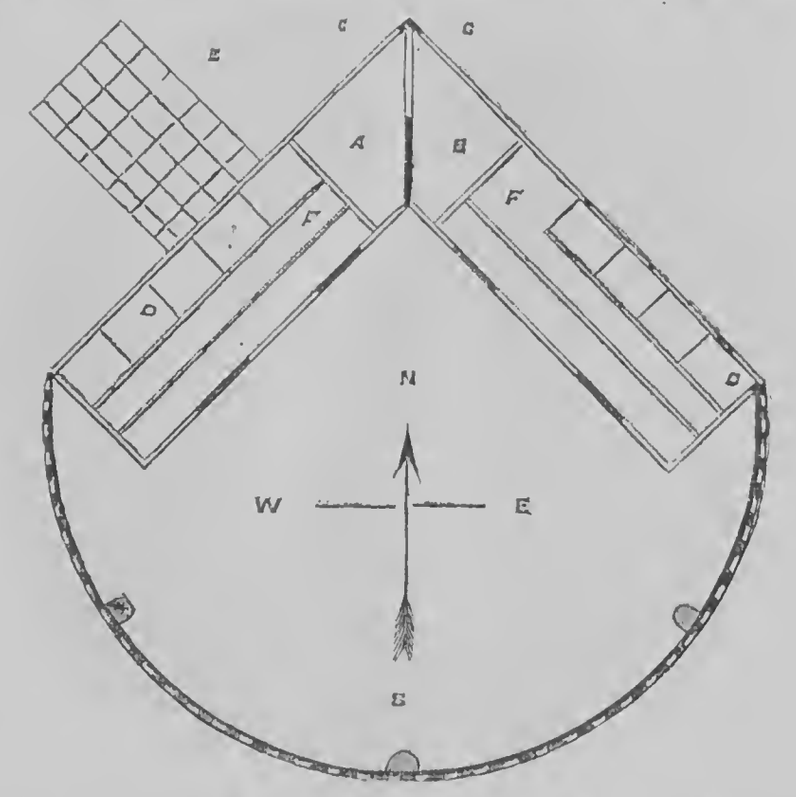
But they did not forsake her and whenever they met her, she was greeted with every manifestation of delight, and was always welcome to eat with them while all the other hens who dared to intrude were driven away with malicious bites, and then they would surround her and with triumphant cackle give her to understand that she only was the honored guest.

This continued for months when one day she was found dead under the roost, and to get her out of the way was thrown into an adjoining lot. Several days after, hearing an unusual commotion among the goslings, we went to them to learn the cause. They had just found her and were evidently trying to get her to recognize them. She was then put out of their sight or reach, as we pitied their disappointed devotion, and so ends this fact of fowl memory and affection.

Mrs. Granger.

FOWLS IN LARGE NUMBERS.

I take the liberty of writing to you for some information as to the possibility of going into poultry, or rather more especially the egg business. I have control of about one hundred acres of land near here, and it has seemed to me that no better use could be made of it than the raising of eggs for Philadelphia and New York markets. Could there not be eight or ten thousand chickens kept on this amount of land by having, say eighty or one hundred coops distributed in different localities containing about one hundred chickens each, and would not the profit on the eggs be better than could be got by using the same land for farming purposes. I have known of some persons going into such business and failing at it, from having, as I supposed, one expensive house and having a couple of thousand chickens, and not having enough range of ground for them. I would propose to give an acre of ground to each hundred chickens and have my coops warm and substantial but not expensive, as I intend going into it as a matter of business to make money. Hoping to have any information you can give me, I am, Yours truly. Subscriber.



PLAN FOR POULTRY HOUSE AND PARK.

I think that Poultry keeping for eggs will pay under careful and thorough management. I further believe it will not pay, with too *many fowls* kept together; it has been tried over and over again, and always failed after a time. Your idea of detached houses, and not more than 100 fowls to each house is the secret of success; 50 or 75 are better. Such arranged houses over any number of acres, 50 to each acre, or two acres to each 100 fowls with house, as far detached as possible, I believe would be more profitable than any ordinary farming. Some of the land might be still utilized by orchards, hay &c., and at the same time given all to the fowls, their dung manuring it, and the turning up of the soil helping to keep the fowls healthy.

But one thing must be borne in mind, in building your houses, that eggs pay best in winter, so to induce them to lay in winter you must build warm winter quarters for them without artificial heat. This is expensive at the start, but the most needful for success. The houses must be lathed and roughly plastered with plenty of glass on the east and south sides, and no openings on the north and west.

I have built such a house banked up on the north and west sides, and find it answers the purpose well. Perches should be horizontal and not on an incline, one higher than the other, as fowls will continually quarrel for the highest perch. Any further questions I shall be happy to answer through the Rural. Henry Hales.

POULTRY AT FAIRS.

It has long been the rule of Poultry Associations not to permit the exhibitors' names to appear on the coops until after the awards have been made; but it is now proposed, in some quarters, to do away with this rule and permit the owners of birds to put their names on the coops, when sent in, without regard to the Judges. We should be pleased to hear from poultry breeders on this subject; but, in the mean time, we give the following from the Poultry Bulletin, which appears to be a fair treatment of the case:

We believe we were about the first to advocate the adoption of this rule by our poultry associations: and now, after six years or more of trial, we can see no good reason for continuing it.

It is a stereotyped rule in nearly all the published premium lists of our many societies, and in very many it is more honored in the breach than in the observance. It had its uses, but the day of its necessity (if such ever existed) has gone by. Very few judges among those who now do the most of that work, but know the type of the strain of most of our principal breeders, as well without any name or card on the pen as if it was there. And of those who are qualified judges, is there one who would so demean himself as to award the prizes to the exhibitor rather than the birds? We hope not.

Looking at it in another light, is it not rather a gratuitous insult to the judge to invite him to award the prizes offered, and then virtually say to him: "We can't trust you, so we won't allow any of the owner's names on the coops, until you get through your work, for fear you might show favoritism in your awards."

The rule is a bad one for exhibitors, as is illustrated so frequently in cases where the judging is not completed until near the close of the show. Visitors come and go, and see fowls which they admire and would like to purchase, but have no clue to the ownership, and know of no one to inquire of. One of the principal incentives to, and benefits from exhibiting fowls, is the advertising of the stock by its appearance in the exhibition pen, with the owner's card attached, so that all may see the ownership and quality of the stock: and this is frequently prevented until the show is about closing, by the enforcement of the rule above quoted. We have again and again heard exhibitors complain of this as entirely neutralizing any good they had expected to derive from exhibiting their fowls.

Let the matter receive attention at the hands of the proper committees, and may this useless and hurtful rule be no more seen on our premium lists.

Imperial Egg Food.—In answer to the inquiry in reference to the Imperial Egg Food, we hear from Mr. S. J. Beston, for many years President of the Connecticut State Poultry Society that he has used this Egg Food for a long time, and he says that it has an invigorating and healthfull effect upon his fowls, that he has it constantly in use, and can recommend it to any of his friends or keepers of gallinaceous or aquatic fowls generally.

The Garden.

THE NEWER TOMATOES.

We notice in the Rural of Dec. 2 some notes on Carter's Green Gage and the Golden Trophy Tomato.

Having experimented largely with all the prominent new varieties which have been introduced of late, we venture a few notes regarding our experience.

Carter's Green Gage was sent to this country by James Carter & Co., seedsmen, of London, Eng., and has, so far as we can judge, proved an acquisition. It grows to a medium size, is round, fair, smooth, early, productive, and ripens perfectly around the stem. Color, yellow. It is much sought after by housekeepers for canning and preserving. It is not, as the article above alluded to intimates, allied to the old Plum Tomato, but is in every way much more desirable.

The Paragon is an excellent variety, to which our attention was first called by Gregory two years since. It possesses all the desirable attributes of a first-class tomato, and we highly recommend it to market growers.

The Conqueror, with us, has proved early, smooth, and very productive, but in size and solidity is inferior to the Canada Victor, which latter, all things considered, is as yet our *best early tomato* for market or home use. It is only excelled by the Trophy in size and solidity, but excels it in earliness and productiveness.

The above-named five varieties we believe to be the most desirable of any yet introduced, and whoever has them all may rest content for a while at least.

Blount's Champion Cluster we have given two trials, both of which show it to be a large late variety, with no particular merit that we could discover.

Hathaway's Excelsior is spherical. It is externally beautiful, but generally lacks that solidity which is essential to a *good* tomato.

The Golden Trophy has an excellent flavor, but we have found it quite a shy bearer, and it is nowhere, in smoothness, to be compared with the Trophy. So much does it lack in this respect that we doubt its being a "sport" of that variety, as claimed.

Turner's Perfection is productive, and that is all we can say in its favor. With us it grew very rough and ripened very late.

Foote's 100-Days' Tomato, which was sent out by the Indiana seedsman whose name it bears, completely disappointed the great expectations which were formed for it by reason of the high praises of its disseminator. In our soil and climate it has no merits whatever, so far as we could judge. In justice to its progenitor, we presume it does better elsewhere.

Ninety-Days' Tomato is the name of still another failure which was sent us last spring. There was nothing so very bad about this variety, and, on the other hand, nothing particularly desirable, so far as we could judge.

La Plume, Pa. Tillinghast Bros.

Insurance Department.

CONDITION OF INSURANCE MATTERS.

There are few people who have not, during the last four or five years, learned from their observations or experiences, the necessity of close scrutiny into the financial condition and conduct of the companies proposing to insure their lives and property. Nor has there been any improvement in the situation to warrant laxity in this respect. Many failures have occurred and the indications are unmistakable that others will follow. A score or more of companies are pursuing almost precisely the courses which have heretofore preceded such an ending, if indeed they have not made disastor inevitable. Despite the long-cherished promises of protection and preventive interference by the Insurance Departments, life companies that have ceased to be profitable to their stockholders manage to precipitate their own dissolution, and cannot be compelled to continue business for the benefit of their policy holders, but so contrive that the alternative lies between a total loss and the almost inevitable swindle of re-insurance. The causes of disasters that are not brought about by collusion are reckless expenditure and a lack of new business. No life company has yet come to grief because of excessive mortality, and none will unless its best risks have been filched from it in the process of re-insuring.

The rock on which the weak fire insurance company splits is excessive losses combined with unremunerative rates of premium. At no time since the great fires at Chicago and Boston have premiums been so small as now. Competition between rival companies has led to alternate under-bidding, or "under-cutting" as it is called, until some companies are abandoning the business, and a host of them, especially of the weaker sort, are inviting calamity. The consequence will be that a comparatively small loss will cripple them, and being unable to pay they will not pay any losses whatever. Farmers have fewer facilities for knowing all this than other people and are therefore more liable to be imposed upon. Their best course in the premises is to insure only with the most stable and reputable companies, whatever the rate of premium required and to avoid those which propose cheapness as an inducement.

As regards the life companies there are half a dozen or more that are beyond the possibility of trouble, and the remainder will disclose their condition with more or less accuracy in their annual reports for the coming year. Until these are forthcoming it is perhaps just as well to hasten very slowly indeed.

CHEAPENING FIRE INSURANCE.

There is an association of fire insurance companies known as the National Board of Underwriters, whose business it is to maintain, if possible, such rates of premium as will be safe and remunerative, and subordinate to this organization are numerous local boards having the same purpose. Neither of them succeeds very well, because their authority is little more than advisory, and in spite of their efforts to the contrary the rates are subject to frequent vacillation in the wrong direction. Just now the rates of fire insurance are very low, and will probably be kept low by competition until some disaster occurs and somebody is hurt. So far as known, this foolish competition has not seriously affected the agricultural insurance companies.

A GREAT SHAME.

Several weeks have elapsed since the Continental Life Insurance Company passed into the hands of a receiver, but the public know as little as before of the condition of its affairs. That official has made no report, and the business remains undone. Though premiums are taken and some sort of credit entered, the receiver discredits, it is said, his authority to issue paid-up policies. At best it is a bad business and a discredit to the name of life insurance.

Floricultural.

BROMELIADS.

All who have traveled through the Dismal Swamp of Virginia or other more southern States could not fail to have observed the Black Moss that drapes the trees in the most somber of dresses.

We recall a stage-coach ride in Southern Georgia the route of which led through a dreary swamp several miles in length that, but for the precarious and tortuous road which had been cut through for the stage, would have been wholly impenetrable. It was in winter. The water of the swamp concealed the road for considerable distances and in many parts was deep enough to cover the hubs of the stage, while the horses stumbled and floundered along as if a passage through without accident were next to an impossibility. The trees were densely thick and the Cypress Knees stuck up their shapeless heads like so many weird, gloomy forms of life that were created but for this "gloomy shade" and were there "weeping their sad bosoms empty." The leafless trees were draped in masses of this Black Moss—the *Tillandsia usneoides* of botany—and its gray, cold, creeping, matted, lifeless appearance completed a dismal *tout ensemble* that, travel this wide world over, would be seldom observed in higher perfection, if we may suppose degrees in that which is itself superlative.

Few that have seen this sad Tillandsia thus, or, in fact, at all, could surmise that it has several sisters possessed of sufficient beauty to be recognized among the choicest of conservatory plants. *Bromeliacea* is the order to which it belongs — the Pineapple family as it may be called. *Ananassa* is the Pineapple, the striped-leaved variety of which, *A. sativus variegatus*, is prized for its coriaceous, finely-toothed leaves, an inch wide, green in the middle, margined distinctly with white. It associates well with such plants as *Dracænas*, and requiring only small pots for its roots, is suitable for brackets or for the decoration of rooms or the table. It may also be plunged during the summer in any part of the garden where desired, without much regard to sun, shade, or soil.

Billbergias and *Aechmeas* also may be confidently recommended to our friends, both as regards their peculiar foliage and the great beauty of their inflorescence. The inflexible leaves recurve in an artificial, vase-like manner to a degree that renders imitations of them in wax only evident upon a close examination. Of the Billbergias, *B. Morreliana* is one of the best. Its flowers are less crowded upon the spike, which droops in a pleasing way from the center and is over a foot in length. *B. thysoidea* forms a dense head of flowers but little raised above the brilliant crimson bracts.

These plants require a loose, fibrous soil, plenty of drainage, and sand sufficient to retain it always porous. Owing to the almost horny texture of the leaves, they are but little liable to the attacks of other insects than scale and mealy bug, both of which, with ordinary care, are kept aloof.

As soon as Billbergias bloom, they throw up suckers from the base. These should be cut off at their junction with the mother plant after they have attained some size and firmly placed in small pots of light soil, where, if not too freely watered, they will soon form roots, and, if then given plenty of light and heat and shifted to larger pots as their growth renders it necessary, they will bloom the second season afterward.

In general terms the same may be said of the Aechmeas. They are easily cultivated; they produce varied and beautiful flowers; the plants never become too large for small collections and the several species bloom at different periods, thus securing a succession of flowers. *A. fulgens* bears bright-red flowers which are attractive for a long time after they have ceased blooming, owing to an appearance they assume which resembles buds yet to open. *A. Mariæ Reginæ* bears spiny leaves, arranged in the same manner as the others, a foot or more long, curving toward the ends. Of this Mr. B. S. Williams of London remarks:

"The flower spike is erect, the lower portion being dotted with large, oblong, boat-shaped bracts of a rich magenta, shaded with rose. These remain for two months in full perfection. The upper portion of the scape is thickly studded with flowers which are tipped with dark blue, changing with age to rose."

But even the Tillandsias themselves must not be judged by the gloomy species with which we began this article. *T. Lindeni major* quite resembles a *Yucca*, with its distichous shape, that in form reminds one of the *Tritoma uvaria*, though its flowers are large, brightly blue, with white eyes. *T. exoniensis* is a climber of a free-blooming habit, with drooping, rose-colored flowers. *T. sanguinolenta* is a native of New Grenada, with foliage of a lively green, spotted all over with red. *T. musaica* is an air plant, as are *T. usneoides* and others of this order. It has strap-shaped, curving leaves a foot long, of a yellowish color, irregularly marked with veins of a dark green, and is thus desirable for its singular foliage. *T. Zahnii* is a novelty introduced from Costa Rica through Mr. Zahn, one of the collectors of James Veitch & Sons of London, after whom they named it. "In habit," Mr. Veitch has described it, "as similar to other Tillandsias, but its beauty lies in the wonderful coloring of the foliage and flower. When in a young state the leaves are of a deep amber color, with distinct veins of red. As the plant advances in age the leaves turn into a rich scarlet, which increases until the time of flowering. The flower spike, thrown some eight to ten inches above the foliage, is surrounded with scarlet bracts; the flowers, which are produced in clusters, are of a rich golden-yellow color."

Other genera of this order, such as *Guzmania*, *Pitcairnia*, *Pourretia*, *Quesnelia*, are offered by florists, some of them in variety and many worthy of a favor, which, except here and there, they do not receive, for the only reason, pure and simple, that they are not known.

CALIFORNIA FLORICULTURE.

I have just been reading your invitation to Rural floriculturists to write and give their experience the past season. Now, I am quite an indifferent hand at both composition and penmanship, but will try to give you my experience for the past season as best I can.

Two years ago I thought I would try my hand a little at flowers, so I sent to Vick and obtained a few annuals, such as Zinnias, Dianthus and Asters. Last season I had the finest Asters in the valley, some of the plants having 130 fine, large, well-developed flowers, and my Zinnias and Dianthus were also very fine. But this season was far ahead of last. My flower-bed is small, say 8x30 feet. In this were one row of Zinnias and one row of Asters of five colors, three rows of Dianthus, and a few Phlox and choice Sweet Williams and Pinks.

From the 20th of June up to the 1st of November my little flower garden has been a perfect blaze of beauty, with every shade of color from the deepest crimson to the most delicate pink, and has been the admiration of the whole neighborhood. I have also about 30 varieties of fine Roses, some of which have been in bloom all the summer, so I have not been out of flowers since May. But now comes the most interesting part of all. Last fall a lady friend gave me some slips of Fuchsias; I divided them into 21 cuttings and set them in a box of rich sediment and soil, and in the spring potted them off in small tin cans, such as oyster and fruit cans, and out of the 21 cuttings I only lost two. They began to bloom in June and have been in bloom ever since. I sold one for $5, one for $3, and one for $2—all to one lady, but the one I sold for $5 was the most beautiful plant I ever saw. It commenced to bloom in May and is in bloom now. It bears a large flower, with very bright, glossy sepals, with a very double, large, purple corolla—at first a bright purple, turning to a beautiful bronze as it grows older, and is from 1½ to 2 inches in diameter. The buds before opening were from ⅞ to 1⅛ inch in diameter, of a bright scarlet color, and almost round in shape. For six weeks it bore from 75 to 110 buds and flowers at a time, and had I been in San Francisco, or some city where there were people of taste, with the means to gratify their taste, I could have easily sold it for $10.

And now as to what I have learned this season. I may say I have learned all that I know this season and last, for I did not know a Phlox from a Zinnia before last season. As to what is my choice, I think that, so far as my experience has gone, Fuchsias, Pinks, Roses and Phlox are about as good as any, take them altogether, as they are easy and quick to raise and very gay and showy.

Lastly, what have I gained by my experience? Well, I have gained a love for flowers, or rather, I have had my love for them awakened, and I have had the greatest amount of satisfaction in tending my plants and flowers at such times as I have had to spare from my daily labors, and if I owned the place on which I live, or any other place where I might put such improvements on as I desired, without being liable to be turned out at any time, I would, in a few years, have grounds worth looking at. A. Culbertson.

Watsonville, Santa Cruz, Cal.

[We have no reason to discredit our correspondent's statement as to the prices which he obtained for his Fuchsias—but as the newest and finest varieties are offered by San Francisco florists at 50 cents each, we think that, in the direction of that city, he would have gone further and fared worse.—Ed.]

NOTES.

Sarcodes Sanguinea (California Snow Plant).—This singular and wonderfully high-colored and tender habitant of the Sierras has attracted much attention from botanists and professional gardeners, as well as commanded the admiration of all who have seen it in its purplish-scarlet splendor, growing like an icicle of blood from the cold soil, under the shadow of dark evergreens which cluster upon the brows of towering mountains.

After all that has been said about the impossibility of propagating this plant, and all the speculations and assertions as to its being a parasite from the roots of the Pine, etc., this plant is actually growing upon the seed in the conservatory of Dr. A. W. Saxe, at Santa Clara. Last year he received several Snow plants, which were taken up near Donner Lake, and, with the earth still adhering to them, transplanted into a common candle-box. Dr. Saxe placed them (still in the box) in a sheltered room under the tank of the windmill, where it was cool and moist. After the plants dried up, he pulled them out of the earth and crumbled the seeds and crowns of the plants in his hands, dropping them into the holes where they had grown. He left the box where it had been placed in the tank room and took no further care of it. And now there are two fine plants, as highly colored and as fine as any that can be found in their native haunts. The soil in the box is the same that was taken up with the plants, and is of a shaly, basaltic, non-siliceous nature.

So says the California Horticulturist. Mr. Jas. Vick says that he has one which was transplanted to a ball of earth and brought across the country. It endured its six days' travel without injury, being liberally supplied with ice-water on the route. It is now forming seeds. He does not expect, should they ripen, that this singular plant will flourish so far away from its mountain home. We think he may derive hope from Dr. Saxe's success.

Lobelia Syphilitica.—Your account of Lobelia is good. I have been over the same ground and observed also the behavior of insects on many kinds of flowers. The scarcity of insects on a species in any certain locality is not a guide for all places. I have seen honey bees and several other kinds very frequent visitors to the Lobelia you speak of in half-a-dozen different counties in several States.—W. J. Beal, *Ag'l College, Mich.*

Arboricultural.

VARIEGATED DECIDUOUS SHRUBS.

The direction given to our interest in plants depends on several considerations. As students of botany, we may be inclined to dwell on the rare and curious features which pertain especially to that science, and lend a thrilling charm to even humble, ignoble weeds. To the severely practical character, the simple idea of shelter from wind and sun will alone present itself; and to the man of taste, little else than the capacities for artistic effects to be educed thereby. Unquestionably, the happiest combination is that of being able to enjoy at once as botanist, practical man and artist.

At present, however, we propose to consider only the artistic point of view. There has been, and is, quite a mania for variegated-leaved plants, and, in England, it has already reached a really enthusiastic stage. But, over and above the mere admiration inspired by a beautiful individual plant, there is a fine opportunity for effect to be derived from the judicious combination of masses of many-colored leaves.

The principles that govern the formation of groups and hedges are very much the same, and consist chiefly in designing harmonious contrasts of color and flowing outlines that, with much graceful irregularity, adhere more or less to the plan of large sizes to the rear or center, and small to the front. The planting of deciduous shrubs is simple, and nearly all, including the variegated-leaved, endure well the hardships of both summer and winter. Given the artistic eye, however, a true sense of color and proportion, a sound, general knowledge of the plant's habits, color and form, when mature, become also necessary. One result of this knowledge will be the establishment of a correct system of pruning to be applied almost universally. This consists in simply cutting out entirely the old wood every three years and trimming the new moderately for symmetry and bushiness, as perfection of leaf and a natural beauty of plant outline are all that is required of such shrubs.

A concise description of certain prominent varieties, constant and reliable in their coloring, may be properly given here as a guide to the accomplishment of desired effects. In this relation, all shrubs divide themselves into two classes of more or less vigorous growth according to the nature of the variety.

The Purple Berberry (*Berberis atropurpurea*) is thorny and strong-growing, of purple-bronze hue, with pretty orange flowers, and, altogether, a sturdy, characteristic plant. It forms in the group a very good foil to the next named kind. *Elæagnus hortensis* is coarse-growing, with whitis-hgray, silvery leaf and wood, quite striking and worthy of employment.

The Sea Buckthorn (*Hippophæ rhamnoides*) is of vigorous, large habit, with small, silvery gray leaves, of much the same general tone as the last. It is particularly adapted for planting by the seaside, resisting bravely the most trying weather and a strong sea air.

Hippophæ salicifolia has a longer, grayer leaf, with a generally duller shade, but otherwise much resembles *rhamnoides*. *Weigela amabilis variegata* is a fine, strong shrub, with marked yellow variegation.

Salix caprea tricolor, is a pleasantly variegated Willow of vigorous, clean habit—very useful for massing.

Spiræa opulifolia aurea is a shrub worthy of high praise for producing contrasts. It is large and grand, with golden-tinted variegation suffused throughout the entire leaf.

Gold and Silver-leaved Elder (*Sambucus nigra aurea* and *argentea*) are large and rapid growing, the leaves blotched broadly with yellow and silver, and peculiarly valuable for much the same effect as the last.

The Purple Hazel (*Corylus avellana atropurpurea*) is perhaps the darkest colored shrub we have. It makes a bush of richest purple, and is invaluable for strong contrasts. The weaker, more dwarfish-growing varieties may be exemplified by the following: *Elegans longipes* is a Japanese shrub, very rare and curious, and of dwarf, bushy habit. The leaf, gray, shining and silvery to a remarkable degree, makes a good foil to the Purple Hazel.

Weigela rosea variegata is marked strongly with yellow, and, though bushy, grows with much vigor. It is very effective in groups.

Buist's Variegated-leaved Althea (*Hibiscus Syriacus variegat. fl. pl.*) is of erect, compact habit, and very distinctly marked with green and white. When grown from cuttings, weakly results are obtained, grafted plants being more satisfactory. The dull-red imperfect flowers are rather a detriment to the beauty than otherwise.

Hibiscus Syriacus variegata, another variegated-leaved Althea, differs much from the last in that the color is more yellow, and the flower of a fine pink and single.

A grafted plant is superior for same reasons as stated in the case of Buist's variety.

Deutzia gracilis variegata is a dwarf, neat and pretty, with yellow variegation and much grace.

Another form of the variegated Deutzia has been sent out recently from Japan to S. B. Parsons & Sons, of Flushing, by Mr. Thos. Hogg. The leaves have a curious, gray, ashy tint, otherwise it is a neat shrub, much resembling Deutzia gracilis.

Hydrangea hortensis aurea and *argentea* belong to a portion of the family that generally dies to the surface of the ground in the winter, coming up freshly in the spring. The variegation is broadly marked, and produces quite a striking effect in groups.

Kerria Japonica variegata is a delicate little shrub, with fine green branches and silvery leaves.

Daphne mezereum purpureum has a richly-tinted leaf, green at first and maturing later into a fine purple.

Daphne cneorum variegata has the usual pretty qualities of the well-known Cneorum, with added beauty in its yellow variegation. The flowers of variegated-leaved plants we have not dwelt on from their general inferiority in themselves, or in comparison with hues about them, but the blossoms of this little plant are so sweet-scented and beautiful that we cannot refrain from offering it a passing tribute. The pruning of the Daphne cneorum and its forms may be profitably varied by cutting out the old wood every year, instead of every third year, as its tendency is to redden and lose its lower leaves on the old wood, especially when exposed to hot sun near buildings or elsewhere. This process renews and strengthens the fresh growth. It will be seen by our description of the more striking variegated shrubs, that a proper regard to their colors and sizes, when mature, may afford scope for the accomplishment of an endless variety of pleasing and graceful effects, all based on the soundest principles of art.

Samuel Parsons.

TREE PLANTING IN THE STATE OF NEW YORK.

The law of New York State, making provision for planting shade-trees along the highway, is as follows: Any person liable to highway tax that shall transplant by the side of the public highway any forest shade-trees or fruit-trees of suitable size, shall be allowed by the overseers of highways, in abatement of his highway tax, one

dollar for every four trees set ent; but no row of elms shall be placed nearer than 70 ft., no row of maples or other forest trees nearer than 50 ft., except locust, which may be set 30 ft. apart, and no allowance as before mentioned shall be made unless such trees shall have been set out the year previous to the demand for said abatement of tax, and are living and well protected from animals at the time of such demand. Such legislation should be copied in other parts of the country.

Domestic Economy.

A WORD ABOUT BUCKWHEAT CAKES.

As the season for pancakes has arrived I send my method for preparing them. At night take sufficient warm water for a little more than the amount of batter required. Thicken this with buckwheat flour, a little graham meal is an addition, stir in a teacup of fresh yeast and let it stand till morning to rise, when it will be fit for use. Leave enough batter to mix in again at night without yeast. After a day or two the batter will require a-half teaspoon or so of soda to sweeten it, put in just before baking. It is nicer to mix your batter in a stone jar and pour off every morning what is required for use and not put the soda into the whole. The addition of a little milk will make the cakes brown if desired.

The batter should be occasionally renewed. Now as to baking cakes it is one of the fine arts. Some heedless cooks use so much grease to keep the cakes from sticking to the griddle that they fill the room full of smoke to the discomfort of all concerned. A cloth sewed fast to a fork is the most convenient greaser and just as little grease should be used as possible. The fire should be neither too hot nor too slack. Nothing is better relished on a cold winter morning than well prepared cakes of this kind.

FARMER'S WIFE.

ORIGINAL RECIPES.

Suet Pudding.—To two coffee cups of flour with a heaping teaspoonful of baking powder stirred thoroughly through it, add one coffee cup of finely chopped suet; one teaspoonful of salt; one well beaten egg; one pint of sweet milk. Grease a tin pail, pour the mixture into it, cover, set it in a kettle of boiling water, and let it boil constantly two hours. Renew the water as it evaporates with boiling water from the teakettle. Send to the table hot. Serve with wine sauce, or lemon sauce.

Wine Sauce.—One coffee cup of sugar, one coffee cup of water, butter the size of an egg, one heaping teaspoonful of flour. Put the sugar, water and butter in a sauce-pan over the fire; when it boils, add the flour made smooth in a little cold water, let it boil two minutes stirring all the time, then add one wine glass of sherry wine. Lemon sauce can be made in the same manner, omitting the wine and using the juice of one lemon.

Children's Pudding.—Fill an earthen baking-dish with finely chopped apples. Season with sugar and nutmeg; add a little water. Set it on the back of the range until the apples are tender. Then make a crust of one teacup of sweet milk; one tablespoonful of butter; a little salt; one teaspoonful of baking powder; flour enough to roll out. Lay the crust on top of the apples and bake. To be eaten hot with sweet sauce, flavored with lemon or vanilla. Other kinds of fruit may be used in the same manner.

Carrot Salad.—Boil a large carrot in salted water until tender, chop it fine, with two hard-boiled eggs. Pour over them a mixture of one tablespoonful of sweet oil three of vinegar a little salt, pepper, sugar, and made mustard if liked.

Rye Cakes.—Beat well together four tablespoonfuls of rye meal, four tablespoonfuls of wheat flour, two eggs, a-half pint of sweet milk, a-half teaspoonful of salt, one teaspoonful of baking powder. Mix the baking powder through the flour. Bake in gem pans in a quick oven.

MRS. RUSTIC.

SELECTED RECIPES.

Welsh Rarebit.—One pound of new cheese, butter the size of an egg, two eggs, one dessert-spoonful of mixed mustard, a little pepper. Beat the eggs thoroughly: cut the cheese in small slices; put the butter in the frying-pan, add cheese, eggs, mustard, and pepper. Cook five minutes stirring all the time. Pour the mixture over buttered dry toast and send to the table very hot.

Another.—One pound of new cheese, one teaspoonful of olive oil, one teaspoonful of mixed mustard, a little cayenne pepper, one-half pint of water. Cut the cheese in small pieces; add water, stir over a hot fire until the cheese is melted; then add mustard, oil and cayenne. Pour this mixture on hot, crisp, dry toast. Put into a covered dish and serve at once.

Fish and Macaroni.—Boil the macaroni in water until tender, drain it and cut it into short pieces. Remove the bones and skin from any kind of white boiled fish, tear it into small pieces, and mix it with the macaroni. Then make a sauce of two ounces of butter, the yolks of two eggs, salt, pepper, and a little lemon juice. Heat this in a sauce-pan, pouring in half a pint of melted butter, stir it, and put in the fish and macaroni. When hot pour it out in a dish, heaping it in the center; sprinkle powdered crackers over it and bake the top a light brown color in the oven.

Oysters and Macaroni.—Slowly stew some macaroni in good gravy till tender; then lay it in a pie-dish, put in a good layer of fresh oysters; add pepper, salt, a little grated lemon peel, and a tablespoonful of cream, or olive oil if preferred. Strew bread crumbs over the top and brown in a quick oven, serve with plenty of lemon juice.

Scalloped Oysters.—Have ready an earthen baking-dish well buttered, sprinkle in a layer of rolled crackers, then a layer of good fat oysters, a little pepper, salt, and bits of butter; another layer of crackers, another of oysters, then seasoning as before, and so on until the dish is filled; have the top covered with crackers; turn over it a cup of the oyster liquor. Set it in the oven for thirty or forty minutes.

Baked Omelet.—Boil half a pint of cream, or rich milk; beat six eggs thoroughly—they will be nicer if the whites and yolks are beaten separately; have a deep dish hot and buttered; stir the beaten eggs, with a little salt, into the cream; put all quickly into the dish, and bake from five to ten minutes, depending upon the condition of the oven. It should be lightly browned, and taken directly to the table in the dish.

Hygienic Information.

FEATHER BEDS.

During the first half of the century just past, a bed made of the feathers plucked from the live geese of the farmer's own raising, enclosed in a striped tick of homespun linen, with a quill from the same birds sewed in each corner to give ingress to pure, and egress to foul air, was no inconsiderable portion of the daughter's "setting out" as a young wife. And the young husband, knowing that this was the product of the handiwork and industry of his young bride, was thus satisfied that she was a help-meet for him and would do her part in the battle of life. In those times, lungs were strengthened and kept in tone by the pure open air of the country, and muscles were fully developed and made strong by their vigorous exercise in providing for the wants and keeping up the thrift of the family. No country folks then dreamed that feathers were unhealthy. But alas! the degeneracy of the race born and bred in more luxurious times and pampered by the machinery which now takes the place of the old hatchel, the spinning wheel, the loom and the needle, has developed the nervous at the expense of the muscular part of the system, and the feather bed has become to many extremely offensive. This is not merely the effect of fashion that has substituted the more expensive hair mattress, but is a stern reality as I shall, by citing a few cases, show.

I asked my lawyer whom I know to be asthmatic, how he liked feather beds? Can't sleep on them; I should'nt get over in two weeks one night's attempt to sleep on one. This friend, born in the highlands of Vermont, had revisited his native mountains, had traveled to Oregon and Puget's Sound, seeking rest and finding no permanent relief except in avoiding feather beds. A lady of refinement and intelligence came in, just as I sat down to write this, who in answer to the inquiry about feather beds replied "can't bear them"—Why? "they make my back ache so." An aged lady replies "don't like them; why, D. C., my niece's husband, can't sleep in the room where there is even a feather pillow lying on a chair, it brings on his asthma so."

A friend with a bad chronic cough of years' standing, brought up on a feather bed to 25 or 30 years of age, and expecting to eventually die with consumption like his mother and some of her children, had come to this conclusion, "Why not?" But by a concatenation of circumstances, he was forced to sleep on a hard mattress which nearly wore the skin from his thinly-clad bones. While thus lamenting his *hard* fate, he found he could not get up a respectable cough. He eschewed feathers, his bones are now cushioned with flesh, and his weight up in the hundreds, and the evil spirit consumption is exorcised.

As to myself (please permit a little egotism) I sleep on a hard mattress made of shreds of wood covered by a thin mattress of cotton, and rest well when my conscience is easy. Could sleep just as well on a mattress of good clean dry wheat straw, which I should empty and stitch over each wheat harvest.

I occasionally go up in the pine woods where I have a temporary home, and where I am given the best bed, a thin feather one, over one filled with bog hay. Could there sleep on anything, even if made of soft pine plank, could I have the whole of it to myself.

A few years since I was taken with a remittent fever which lasted seven weeks. During this time I went into the country a few miles and remained six days with a farmer friend in a log house, and was given the best bed and a room in the chamber to myself. Mine host and his lady were educated and refined and my room and everything pertaining to it were as clean as a brown-stone-front parlor. The pure country air came through the chinks between the logs to my heated brow, but I could not sleep well, and I lay lamenting that I had not strength enough to lift off the feather bed. The next night I had it taken off and my rest after that was much improved.

My own opinion of a good hygienic bed is that it should be made of some yielding or elastic material, other than feathers, the material tied so as to remain when unoccupied flat and level, and laid upon a level foundation though boards with a little spring are not objectionable.

An objection to steel spring bedsteads is, that they give too much pressure to that part of the body between the rib and hip bones, which was never intended to receive pressure from without. I cannot give the rationale of this peculiar effect from feathers, especially new ones, any more than I can of a similar but more decided effect from an open package of ipecac. I have seen a man with irritable lungs, though not claiming to be asthmatic, standing in the same room but some 30 feet from where a package of this drug was opened, with no currents of air intervening, almost strangled with a cough which he could only abate by going into the open air. Neither he nor his physician would believe in the cause till other similar cases were cited. "Why!" says the M. D., "we give ipecac for a cough." Any one doubting these idiosyncracies as to this drug are referred to "Flint's Practice of Medicine."

In the "Transactions of the American Institute" for 1848, page 170, is an interesting essay headed, "Wool mattresses, the best material and the only one that ought to be used for bedding for all ages and all ranks." S. B. PECK.

Muskegon, Mich.

TO PREVENT CHOLERA INFANTUM IN AN INFANT.—The infant must never be permitted to overload its stomach, and, if nursing, or on a diet of a cow's milk, it must not be fed oftener than every three hours, and as near as possible on the same hours every day. It should never eat between 8 P. M. and 4 A. M. When weaned so as to eat adult food, the intervals should be at least five hours—no lunches between meals.

Farm Economy.

FATTENING OF STOCK.

WHILE nearly every farmer knows how to keep his animals fat or at least in good condition, there are doubtless many who knew little or nothing of the principles of the assimilation of food, or why one kind should be so much better than another. The English Agricultural Gazette has published of late several articles on this subject, from one of which we condense the following:

After an animal is born it derives its entire nourishment from vegetable matter. Even the carnivora, or flesh-eaters, feeding as they do upon herbivorous creatures, derive their food, originally, from the vegetable kingdom.

Oxen and sheep may be looked upon as concentrators of the grass and turnips upon which they are fed, in order to present the nutritive matters they contain in a convenient form to man. It is therefore evident that plants contain in their leaves, roots, stems, and seeds, the requisite elements for building up the animal body. The digestive system possesses the power of converting the materials which have previously existed in the plant, into tissues useful for the animal's increase and preservation. Nor is the transformation from vegetable to animal matter a process involving so radical or complete a change of properties in the materials employed, as might be supposed. Viewing the animal apart from its wonderful powers of volition, locomotion, intelligence—apart from its mental properties—we may consider it as a growth only. Looking thus at a fattening animal, we find that the constituents of the food it consumes reappear fixed in its organization with wonderfully little change of chemical composition.

After artificially driving off the water, there remains a dried mass, nearly all of which is combustible. It is the dried portion which we have now to especially notice; which is known to chemists as organic matter, or matter collected and formed by an organism. This consists entirely of two important groups, the non-nitrogenous and nitrogenous, or, in accordance with certain properties, especially possessed by each, the non-nitrogenous substances are spoken of as fat-producers, heat-producers, and respiratory compounds, while the nitrogenous substances are styled flesh-formers.

The non-nitrogenous section is composed largely, and often chiefly of crude fibre, or material which is either indigestible or slowly digestible. It exists in the largest proportion in mature stems, leaves, and straws. Wheat and barley straw contain 48 per cent., meadow hay 30 per cent., and some of the clover hays only 25 per cent. The older the fodder the more abundant is the indigestible fibre, and hence the general esteem in which young fodder is held. As an example, it has been found that red clover in full blossom (the best period at which to cut it) contains 35 per cent. of crude fibre, but ripe clover contains as much as 48 per cent. The larger the proportion of crude or indigestible fibre the less valuable will be the fodder. But it will be found that cattle, owing to the great size of their food receptacle, or paunch, require bulky material, and this nature provides in the crude fibre. Oxen can live upon straw and comparatively innutritious food, while sheep should be fed upon nutritious hay; and pigs, owing to the small size of their stomachs, must be allowed food of still higher concentration.

Fat must be regarded as a surplus product, which only accumulates when an animal is fed beyond its requirements. The natural temperature of the body, on the other hand must be kept up: heat production is thus the first use of the carbo-hydrates, and when that want is satisfied the surplus assimilable material is stored in all parts of the body as fat. The bear retires to his hybernating den full of fat, but emerges in the spring as lean as a scarecrow. He has been "living upon his fat" during the winter, and comes out in the summer to lay in the supply. The fat may be looked upon as a magazine of heat or of animal fuel, and, if need be, the system at once avails itself of the store and uses it. Hence the importance of keeping animals warm, or at least in comfort, for by such treatment less of the carbo-hydrates are converted into warmth, and a larger proportion is stored up in the form of fat.

As the fattening of animals for the butcher is correctly supposed to mean the accumulation of fat more than of anything else, the importance of fat-formers in the food is very great. Hence the cereal grains, malt, maize, hay, potatoes, and all vegetable products rich in starch, sugar, or pectin, are valuable foods.

Still more remarkable is the fact that vegetable foods contain oils and fats. These vegetable fats are simply transformed by the animal into animal fats without any change of composition; and the transference of vegetable fat to the animal body is effected with so much ease, that it is considered to be worth, for feeding purposes, two-and-a-half times its weight of starch or sugar. Linseed cake contains about 10 per cent. of fat or oil, and about 40 per cent. of other carbo-hydrates. The value of the oil is equal to 30 per cent. of starch or sugar, and hence the total carbo-hydrates in this highly esteemed food is equivalent to 70 per cent. of starch. When to this high percentage as fat-formers is added the 28 per cent. of albuminoids which usually exist in a good linseed cake, we have no difficulty in understanding why it is so highly valued by farmers.

A CHEAP SMOKE-HOUSE.

SUCH of the readers of the RURAL NEW YORKER as have no such convenience as a regularly constructed smoke-house may supply the deficiency in the following manner. Dig a narrow pit twelve to eighteen inches deep throwing the earth all out on one side. From near the bottom of this pit dig a trench of the length of one or two joints of stove-pipe at such an angle as will bring the end away from the pit to the surface of the ground. Over the end of this pipe set a common flour barrel or large cask, as may be needed, and having removed both heads, bank up around it with the loose earth, so that no smoke can escape at the bottom.

Hang in the hams, shoulders &c., using something like a broom handle to run through the strings. Putting a cover on top of the sticks will leave space enough for draught, to let the smoke pass freely. Build a smoke fire of corn cobs, damp hard wood sawdust or fine chips, and you will have a cheap, safe and efficient smoke-house with very little trouble. W.

Alden, N. Y., Dec., 1876.

SATURDAY, DEC. 16, 1876.

THE RURAL AS A FAMILY EDUCATOR.

OUR readers will bear witness that we do not, as a general thing, devote our editorial columns to advertising ourselves or to praising our works, and we think they will hold us excusable if now, at the time when the year draws to a close, we express an opinion as to the benefit that may be derived by every family in the land from the reading, by all its members, of such a paper as we desire and intend to place before them.

Many farmers and other rural people, do not realize the value of a good family paper as an educator of their children. Indeed, it is not possible for a young man or a young woman to grow up and enter well-bred society with credit to themselves and honor to their parents, who have not had some of the best publications of the day laid before them for a number of years. Farmers, therefore, make a serious mistake when they neglect to renew their subscriptions to any good paper that comes to them. The question is not so much, "am *I* benefited by taking the ——?" as it is, "are my *family* benefited by reading it?" A farmer may give his children a good, common education at the district school; but that alone will not suffice in this age of progress. They must be more generally informed; and where is the paper better adapted for this purpose than the RURAL NEW-YORKER? We claim that it is not possible for any young person to read it carefully for a few years and then not to be qualified to go out into the world with credit to himself or herself and honor to their parents.

The question will come up, perhaps, with some of our subscribers, "Can I afford to renew my subscription?" feeling the effects of the stagnation of business. But this dullness in trade does not affect farmers to any considerable degree, as the prices of farm products are quite as high as can be expected in the unsettled condition of our political and monetary affairs; and there is no probability of prices ruling lower than they now are. We prefer that our present subscribers should join clubs of *ten*, or more, and then get the paper for only *two dollars*, postpaid! This is less than four cents per week! Is there a farmer in the United States who cannot afford to pay that little sum for such a paper as the RURAL NEW-YORKER? We think not. In fact, we know there is one not worthy of the name of farmer so poor as not to be able to subscribe for 1877.

TO CLUB AGENTS.

There are many men—especially young men—who have abundant leisure to get up a club for the RURAL, but hesitate to send to us for sample copies and Premium List, because they have never got up a club for any paper; and we presume that they think that if they fail to get up a club they *would owe us an apology*. But we expect nothing of the kind. All we ask is, that every reader of our paper who is inclined to *try* to get up a club, shall send to us for sample copies and a Premium List—which are *free*—and proceed immediately to make an effort to get up a club. Nor should any time be lost, as December is the best month of the year to get up clubs. The most successful canvassers are those who call on their friends in the evening; but any time will do. Many beginners, in getting up clubs, are apt to be discouraged if they do not meet with immediate success; but they should persevere.

Another point is, that when you have obtained a few subscribers, if you have not time to finish your club, send in your list with the money and *include your own name*, and when you have completed your club, the $2 sent for your own copy may go to pay for the paper to some other member of the club, you being entitled to a free copy as club agent. The advantage of so doing is, that your subscribers receive their papers without delay and you get a copy weekly which may be used in canvassing. But in such cases we require agents to say, when they remit parts of clubs, "I am getting up a club."

SAVINGS BANK DIVIDENDS.

CONSIDERABLE discussion has arisen of late relating to the proper portion of the earnings of a savings bank to be divided among the depositors. Formerly, each bank divided what the trustees saw fit to declare; sometimes it was from the earnings of the period for which the dividend was made, and at others surplus earnings of former years were used, and even the deposits themselves were encroached on to make a large dividend, which should serve as an advertisement and draw other deposits. Then, old banks with large deposits and heavy surplus could pay eight or ten per cent., while younger ones could not pay more than five or six.

The recent law provides that no bank shall pay more than six per cent., but gains above that amount shall be set aside and after accumulating a surplus of ten per cent. of the deposits, further surplus shall be divided every three years among depositors, as they may be entitled to it. A depositor in a savings bank has this claim on the trustees and this only, viz., —that they shall receive his money, invest it to the best advantage and return it to him on demand, together with its earnings, less its proportion of the expenses attendant upon its management. He does not become a stockholder (in this State there are none in savings banks) nor is he entitled to any portion of the gains or profits that the bank may have made before he became a depositor, and the question, what shall be done with the gains or the surplus of the bank, if any, does not, in equity, affect him in the least. Whether a bank be allowed to accumulate a large surplus at the expense of previous depositors, is a question not in order. Having it, it is proper that it should pay its proportion of the expenses of the bank and in this way the present depositor is slightly benefited. If money can be safely invested at only six per cent. and it costs one per cent. of this to pay the expenses, clearly the depositor is entitled to but five per cent. interest.

It seems to us that the original end and aim of savings banks are lost sight of. Were they not instituted mainly for the purpose of furnishing places where the savings of the laboring classes could be safely kept instead of, as seems now to be generally understood, places where large interest could be obtained? We know of instances during the past year where men of wealth, unable to find paying investments with good security, have deposited their money in savings banks having large surplus, with the expectation that a portion of the six per cent. they would receive would come from the interest on that surplus. This certainly is not right. A savings bank should have a surplus sufficient to enable it to guarantee its depositors and no more. Nor should the pressure of the depositors on the trustees for large interest be so great as to encourage them to adopt such means to make money as are at all hazardous. True, the law points out how the money shall be invested; but trustees sometimes find ways to evade the law, or to give more than legal interest, even if it requires false affidavits to secure it, rather than have depositors dissatisfied.

That the expense of managing banks with small deposits must be proportionately larger than with large ones, is plain. The deduction is, to have less in number. Evidently, there are more now than are profitable—more than are needed.

RURAL NOTES.

Agricultural Implement Manufacturers.—The National Association of Manufacturers of Agricultural Machinery holds its next meeting at Auburn, N. Y., Dec. 20, 1876. To this meeting a general invitation is extended to all manufacturers of such machinery other than hand power, and a large attendance and participation is looked for. The entrance fee is $5 and the annual dues $5. It is hoped that the intercommunication resulting from these meetings will obviate many of the now unpleasant and unprofitable features of this line of business. It is expected that some few, feeling themselves strong enough to do without the Association, will hold back for a time; but there can be but little doubt that the Society, on the other hand, can be made quite strong enough to produce its beneficial results without such members. And when its advantages accrue, this conservative (another name for selfish) element will be glad to claim membership. The officers are: President—D. M. OSBORNE. Vice-President—J. J. CASE. Treasurer—P. P. MAST. Corresponding Secretary—BURNET LANDRETH of Philadelphia.

Concussion-Theory Abroad.—Col. HARDEE of Florida, was much laughed at, a few years since, for claiming that insects could be driven out of orchards by what he termed "concussion"—that is, sudden jarring of the trees, or by firing off a gun near them. We notice, of late, that this concussion theory has been rapidly spreading, and at least one orange grower at the South asserts that the orange-scale disappears from the effects of firing a gun among the branches or under them a few times. Now an Austrian has been blowing up the soil among his vines with dynamite and reports that it is a perfect success in the way of destroying the *Phylloxera* or grape louse. We can only hope, if concussion proves to be a perfect remedy for this pest, that Col. HARDEE will get the 100,000 francs offered by the French Government for an effective method of destroying it.

Wasting Money.—A lady correspondent of a Western paper complains bitterly of the money "wasted" in the bronze statues erected in honor of illustrious men, but she fails to tell us where the "waste" comes in. Were she the wife of any one of the hundred men who must necessarily be employed in getting the material together to make even one of the smallest and cheapest of these statues, she might be enabled to look upon such things in a different light. Money cannot be wasted in making statuary, fine pictures or costly silks; for the poor laborers—even down to those who dig the metal from the earth, grind the pigments, and the women and children who feed the silk-worms with mulberry leaves—all get a share, and the person whose mental philosophy fails to see this in its proper light, must have a gloomy walk to tread. There may be an unequal distribution of blessings in this world, but money can scarcely be wasted when used to employ and feed industrious persons.

Good Old Times.—W. C. KERR, in writing to The South about silk culture, talks of the "good old colony times" just as though the people of this country were better off and more happy when subjects of Great Britain than now. It is a pity that farmers who prate about "good old times" could not be sent back a century or two and be compelled to taste a little of the article which they hold in such high estimation; for if history teaches any one thing more than another, it is that at no period since the human race appeared on this earth are those belonging to civilized nations so prosperous as at this very time.

The Old and New Saw.—There are probably some carpenters among the readers of the RURAL NEW-YORKER who can remember the time when the name of JOHN SPEAR, Sheffield, Eng., or his successors, SPEAR & JACKSON, on the handle and blade of a saw, was almost a positive necessity to insure a sale, for those of American manufacture were as untrustworthy as the signs of the moon in foretelling the weather. But there has been a great change made in the quality of American saws in the past few years and, strange as it may appear, Sheffield, Eng., is becoming a good market for them.

RURAL BREVITIES.

OYSTERS are great admirers of SHELL-Y.

THE Egyptian horse plague is becoming Syrias.

CALIFORNIANS are showing their sound good sense by importing Norman horses, instead of breeds only fitted for the race-course.

THE occasional failure of the Belgium flax crop is attributed to a kind of rust which attacks the plants growing in soils deficient in potash.

THE Poultry Associations are now busy preparing or holding their annual exhibitions and, from present prospects, there will be a larger and better display of fine birds than ever before.

M. LAFERIERE, a French Veterinarian, is reported to check contagious disease among cattle by burning sulphur in their stalls. Thirty grains of sulphur is burnt for every cubic yard of air in the stable.

AGAIN the farmers of the West have neglected to raise beans enough to supply the demand of their home market, and dealers in provisions are sending East for large quantities of this staple article of food.

THE Canadians are talking of a large exodus of farmers to Manitoba next spring, showing that there are more people who prefer to endure the rigors of a still colder climate than run the risk of dying from yellow fever in the South.

IT is extremely difficult, even if possible, to starve out the most arrant swindler if he spends money freely in advertising, and we have often wondered why more honest men did not take the hint and use the same means to make money.

OUR old-time friend, P. T. QUINN, is engaged in the compilation of the transactions of the New Jersey Centennial Commission. It is to be hoped that he will include a full description of the Tournament and the part taken therein by her representatives.

THE THIRD ANNUAL CONVENTION of the Pennsylvania Dairymen's Association will be held at Cambridge, Crawford Co., Pa., Wednesday and Thursday, Dec. 27th and 28th. Many of our leading dairymen are expected to be present and take part in the proceedings.

BLACKWOOD'S Magazine has long been considered a pretty good authority in literary matters, but we suspect that some of our farmers will take exceptions to its assertion that the "moon has no more effect on the weather than red herrings have on the government of Switzerland."

THE largest yield of corn reported this season comes from Alabama, one W. T. TURNLEY claiming that he has produced 221 bushels per acre, but whether in ears or shelled corn we are not informed; but either is a large enough yield to make one slightly inquisitive to know how it was done.

WE should like to have those who are believers in the theory that all varieties of potatoes are predisposed to run out or degenerate, account for the presence this season of as fine Mercers as were ever seen here thirty or forty years ago. In fact, we think there is a slight improvement in this variety, both in size and quality of the tubers.

IF there should come a Black Walnut fever in this country, Prof. BEAL of the Michigan Agricultural College would be the man to blame for it, for he has been reporting the sales of trees of this kind at one thousand dollars each and upwards. The age of these trees, however, was not given which, if it had been, might have discouraged planting of Black Walnut for timber.

ON THE DOWNS.

A faint sea without wind or sun;
A lifelike flameless vapor dun;
  A valley like an unsealed grave
That no man cares to weep upon,
  Bare, without boon to crave
    Or flower to save.

And on the lip's edge of the down,
Here where the bent grass burns to brown
  In the dry sea wind, and the heath
Crawls to the cliff's side and looks down,
  I watch, and hear beneath
    The low tide breathe.

Along the long lines of the cliff,
Down the flat sea-line, without skiff
  Or sail or black-blown fume for marks,
Through wind-worn heads of heath, and stiff
  Stems, blossomless and stark,
    With dry sprays dark.

I send my eyes out as for news
Of comfort that all these refuse.
  Tidings of light or living air
From windward, where the low clouds muse
  And the sea, blind and bare,
    Seems full of care.

[*Charles Swinburne.*

FASHION NOTES.

New York, Dec. 9, 1876.

The very sudden and severe change in the weather brings the question of winter wraps forcibly to mind, and as heretofore I have given undivided attention to the ladies, it seems only just

4566 4566

that the boys and girls should be considered. To this end I have selected and give patterns of cloaks, coats, &c., that I think will be found appropriate, serviceable and stylish.

The girl's Dolman paletot bears a resemblance to many of the ladies' wraps. The model is of cloth with braid trimmings and buttons, and is fitted in the manner peculiar to the Dolman. The fronts are quite long and narrow, and for about half their length from the shoulders connect with curving sleeve-portions, which are held a trifle full at the shoulders and are sewed to the back for its entire length. The back is considerably shorter than the front and sleeves, and has a center-seam that permits a graceful spring below its termination, which occurs at the waist-line. Extra widths are allowed at the end of the seam, that on the right half being extended over the left in a diagonal lap. The sleeve has no seam, except the one joining it to the body of the garment, and consequently droops loosely over the arm. A belt, fastened at the front, draws the paletot gracefully to the figure, without hindrance to an easy movement of the arm or the fall of the sleeve. A bias band, rounded off at the ends, completes the neck; and the braid trimming is arranged on the front in diagonal lines, which meet in V-outline at the closing, while their ends are fastened in short loops. The braid is continued in pointed-collar form below the neck at the back, and a single row followed by a line of buttons defines the position of the shorter rows. Any cloth adapted to the season may be used. The pattern (No. 4599) is in 7 sizes for girls from 3 to 9 years of age. Price 25 cents.

No. 4587 is a gored basque for girls from 8 to 15 years, in 8 sizes—(25 cents.) The central portions of the back and front are each laid in six plaits turning inward and clustering closely about the neck at their upper terminations. Those in the front aid materially in adjusting the garment gracefully to the figure, as they overlap each other considerably at the waist-line, below which their seams are left open, allowing them to flare out prettily in fan outline toward the bottom. A

4587 4587

similar result is brought about in the back, where side-front, under-arm and side-back gores complete the adjustment. The skirt shows only variation enough in length to produce a symmetrical outline, and the seams of the gores in the back and front are finished with a piping of a darker shade. The coat-shaped sleeve is cut high enough at the top to conform to the length of the shoulder, and the wrist is completed with a narrow cuff flaring downward and having only an outside seam. The lower edge of the cuff, as well as the seam joining it to the sleeve, is piped with the silk; and the neck has a similar finish, inside of which is sewed a lace ruche. A wide silk belt, formed of narrow upward-turning plaits laid

4579 4579

crosswise on a lining of crinoline, confines the garment snugly to the figure, and is itself fastened with a handsome buckle.

The child's sack (No. 4566) is made of heavy cloth, trimmed with facings and bands of silk of a dark shade. The adjustment is performed by shoulder and under-arm seams and the garment, though very long, is loose enough to allow a free movement of the little wearer's limbs. Each side of the front has a deep pocket, turned down at the top to form a lap, from which an inverted V-shaped opening is cut, so that it falls in two points which are faced with silk. The sleeve is in coat-shape, and has a cuff whose corners are reversed at the outside seam and faced with silk to harmonize with the pocket-lap. The cape-like collar is slashed for about half its depth through the center, and the corners of the slash, as well as the ends in front, are reversed with silk. A sack of this style may be made of velvet, plaid flannel, waterproof cloth, heavy cloth, or any seasonable fabric. Lines of machine-stitching, bands of silk or velvet, or rows of braid, are appropriate trimmings. The pattern is in 6 sizes, for children from 1 to 6 years. (Price 20 cents.)

A very nice sack for elderly ladies is illustrated in No. 4,584. The front is in double-breasted sack shape, and the back is in the popular French mode, being quite narrow and having a curved seam through the center. The skirt is of medium depth, and presents a uniform outline slightly deepening at the back. The upper parts of the front are faced and piped with silk, and the left side is turned back in a *revers*, while the right underlaps it or is also turned back, at the pleasure of the wearer. The front is closed its entire length below the *revers* with buttonholes and natural-wood buttons, a second line of buttons being arranged on the overlapping side,

4584

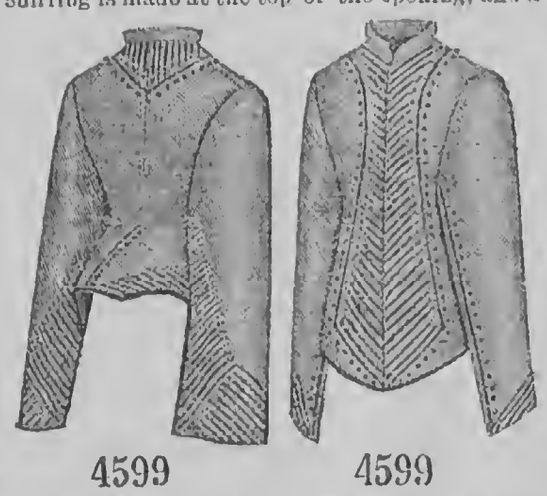
while a hook and loop are caught together under the collar. The sleeve is quite wide at the wrist, where it is elegantly completed by a handsome flaring cuff having a silk lap finished with piping sewed to the top and then reversed. A deep Byron, or turn-over collar, faced and piped with silk, rolls about the neck, forming a stylish and comfortable completion to this part of the sack.

The shape is suitable for any material in vogue for such garments, and, owing to its elegant outline, but little trimming is necessary. Beaver, or rough-faced cloths are very often made up in this way, as but few seams are introduced, a point which should always be observed in making up heavy cloths. The pattern is in 13 sizes. Bust measure from 28 to 46 inches.

The girls' coat with a deep adjustable vest (No. 4,579) is very pretty made up of a combination of light-colored cashmere and a silk of contrasting shade. The front portions of the garment proper fall over a deep silk vest, which runs into the shoulder-seams and depends in two little diagonal tabs below the closing. Side-backs and a center-seam adjust the back nicely, and at the waist-line of each side-back is a forward-turning plait formed of narrow extra widths, allowed for the purpose. A pretty pointed silk lap, holding three buttons covered with cashmere, is sewed in with the seam below the waist-line; and the center-seam has a narrow extra width on the skirt, which is extended from the left half over the right in a straight lap. Large pockets, turned down in pointed laps that are faced with silk and ornamented with buttons, are finished on the remaining edges with silk pipings and then placed over the hips, adding a jaunty look to the garment. The skirt, and the overlapping edges of the front, are finished with piping; and the coat-sleeve is completed with a cuff whose upper edge is faced and tacked down under buttons, to match the pockets.

Two shades of blue, brown or gray, combine prettily in garments of this style, and the materials may contrast or harmonize in texture. The introduction of the vest, and the diversity observed in the arrangement of the back render it particularly charming and picturesque. Elaborate trimmings are not required, and are indeed out of place, though there are a number of simpler kinds from which a selection may be made, braid, velvet, cordings or fringes being among the most suitable. In seven sizes for girls from 3 to 9 years old.

The misses' overskirt, No. 4603, is one among the many pretty ways of treating skirts. Draping has, however, become a matter of individual fancy, the stereotype of fashion being remarkable by its absence. The material illustrated is soft serge, and the garment consists of a wide gore and a full back-breadth. The gore forms the front and sides of the skirt, and displays two styles of drapery. The fullness is removed from the top by means of darts, and three deep plaits, overlapping and turning upward, are clustered in the right side-seam near the bottom. The left side is particularly effective in appearance, being slashed from the bottom for about ten or twelve inches, and then reversed as illustrated. A short shirring is made at the top of the opening, and a



4599 4599

corresponding one is inserted at the left side-seam. As represented, the plaits raise the right side quite high in graceful folds and wrinkles, while the left falls comparatively low, revealing the ornamentation of the dress skirt through the opening. The back is longer than either side, and where it joins the belt is arranged in six side-plaits turning toward the center. A tape, fastened at the center of the belt and tacked twice to the breadth at intervals far enough apart to produce a stylish fullness, drapes the back prettily, two other tapes being tacked at the side-seams and tied together to hold the fullness in position.

Mourning Goods.

The mourning goods look gloomily down upon us from rows of well filled shelves. In the "heavy affliction" department is an extensive assortment of such leading fabrics as Henrietta cloth, bombazine, Imperial serge, Cashmere, mohair, *drap d'ete*, crepe cloths and barathea, in prices ranging from sixty-five cents to $2.25 a yard. Henrietta cloths with silk warp are from $1.37½ to $2.75 per yard, and with cotton warp from forty-five cents to $1. Camel's hair, fancy and plain, light and heavy, from $1 to $7.50 a yard. The latter is seventy-two inches wide. Fancy *matelesse* from sixty five cents to $3 a yard. Diagonals and serges, forty-eight inches wide, from $1.25 to $2. Then there is a heavy satin faced *matelesse* for cloaks and sacques at $3.50 a yard. Courtauld's English crepes are still the most famous for trimming and veils, and are sold at $1.25 to $10 per yard. Frolic.

The Story-Teller.

A MAN WHO LOST HIS NAME.

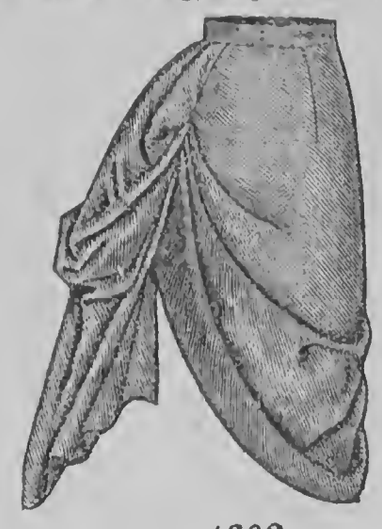
[Concluded from page 382.]

VII.

After that eventful December night, America was no more what it had been to Halfdan Bjerk. A strange torpidity had come over him; every rising day gazed into his eyes with a fierce un-

4603

meaning glare. The noises of the street annoyed him and made him childishly fretful, and the solitude of his own room seemed still more dreary and depressing. He went mechanically through the daily routine of his duties as if the soul had been taken out of his work and left his life all barrenness and desolation. He moved restlessly from place to place, roamed at all times of the day and night through the city and its suburbs, trying vainly to exhaust his physical strength; gradually, as his lethargy deepened into a numb,



4603

helpless despair—it seemed, somehow, to impart a certain toughness to his otherwise delicate frame. Olson, who was now a junior partner in the firm of Remsen, Van Kirk & Co., stood by him faithfully in these days of sorrow. He was never effusive in his sympathy, but was patiently forbearing with his friend's whims and moods, and humored him as if he had been a sick child intrusted to his custody. That Edith might be the moving cause of Olson's kindness was a thought which, strangely enough, had never occurred to Halfdan.

At last, when spring came, the vacancy of his mind was suddenly invaded with a strong desire to revisit his native land. He disclosed his plan to Olson who, after due deliberation and several visits to the Van Kirk mansion, decided that the pleasure of seeing old friends and the scenes of his childhood, might push the painful memories out of sight and renew his interest in life. So, one morning, while the May sun shone with a soft radiance upon the beautiful harbor, our Norseman found himself standing on the deck of a huge black-hulled Cunarder, shivering in spite of the warmth and feeling a chill loneliness creeping over him at the sight of the kissing and affectionate leave-takings which were going on all around him. Olson was running back and forth, attending to his baggage; but he himself took no thought and felt no more responsibility than if he had been a helpless child. He half regretted that

4584

his own wish had prevailed and was inclined to hold his friend responsible for it; and still he had not energy enough to protest now when the journey seemed inevitable. His heart still clung to the place which held the corpse of his ruined life, as a man may cling to the spot which hides his beloved dead.

Two weeks later, Halfdan landed in Norway. He was half reluctant to leave the steamer, and the land of his birth excited no emotion in his breast. He was but conscious of a dim regret that he was so far away from Edith. At last, however, he betook himself to a hotel, where he spent the afternoon sitting with half-closed eyes at a window, watching listlessly the drowsy slow-pulsed life which dribbled languidly through the narrow thoroughfare. The noisy uproar of Broadway chimed remotely in his ears, like the distant roar of a tempest-tossed sea, and what had once been a perpetual annoyance was now a sweet memory. How often with Edith at his side had he threaded his way through the surging crowds that pour, on a fine afternoon, in an unceasing current up and down the street between Union and Madison Squares. How friendly, and sweet, and gracious, Edith had been at such times; how fresh her voice, how witty and animated her chance remarks when they stopped to greet a passing acquaintance; and, above all, how inspiring the sight of her heavenly beauty. Now that was all past. Perhaps he should never see Edith again.

The next day he sauntered through the city, meeting some old friends, who all seemed changed

and singularly uninteresting. They were all engaged or married, and could talk of nothing but matrimony, and their prospects of advancement in the Government service. One had an influential uncle who had been a chum of the present Minister of Finance; another based his hopes of future prosperity upon the family connections of his betrothed, and a third was waiting with a patient perseverance, worthy of a better cause, for the death or resignation of an antiquated *chef-de-bureau* which, according to the promise of some mighty man, would open a position for him in the Department of Justice. All had the most absurd theories about American democracy, and indulged freely in prophecies of coming disasters; but about their own Government they had no opinion whatever. If Halfdan attempted to set them right, they at once grew excited and declamatory; their opinions were based upon conviction and a charming ignorance of facts, and they were not to be moved. They knew all about Tweed and the members of the Tammany Ring, and believed them to be representative citizens of New York, if not of the United States; but of Charles Sumner and Carl Schurz they had never heard. Halfdan—who, in spite of his misfortunes in the land of his adoption, cherished a very tender feeling for it—was often so thoroughly aroused at the foolish prejudices which everywhere met him, that his torpidity gradually thawed away and he began to look more like his former self.

Toward autumn he received an invitation to visit a country clergyman in the North, a distant relative of his father, and there whiled away his time, fishing and shooting, until winter came. But as Christmas drew near and the day wrestled feebly with the all-conquering night, the old sorrow revived. In the darkness which now brooded over land and sea, the thoughts needed no longer be on guard against themselves; they could roam far and wide as they listed. Where was Edith now—the sweet, the wonderful Edith? Was there yet the same dancing light in her beautiful eyes, the same golden sheen in her hair, the same merry ring in her voice? And had she not said that when he was content to be only her friend, he might return to her and she would receive him in the old joyous and confiding way? Surely there was no life to him apart from her—why should he not be her friend? Only a glimpse of her lovely face—ah, it was worth a life-time; it would consecrate an age of misery, a glimpse of Edith's face. Thus ran his fancies day by day, and the night only lent a deeper intensity to the yearnings of the day. He walked about as in a dream, seeing nothing, heeding nothing, while this one strong desire—to see Edith once more—throbbed and throbbed with a slow, feverish perseverance within him. Edith—Edith; the very name had a strange, potent fascination. Every thought whispered "Edith"—his pulse beat "Edith"—and his heart repeated the beloved name. It was his pulse-beat,—his heart-beat—his life-beat.

And one morning as he stood absently looking at his fingers against the light—and they seemed strangely wan and transparent—the thought at last took shape. It rushed upon him with such vehemence, that he could no more resist it. So he bade the clergyman good-by, gathered his few worldly goods together and set out for Bergen. There he found an English steamer which carried him to Hull, and a few weeks later he was once more in New York.

It was late one evening in January that a tug-boat arrived and took the cabin passengers ashore. The moon sailed tranquilly over the deep-blue dome of the sky, the stars traced their glittering paths of light from the zenith downward, and it was sharp, bitter cold. Northward over the river lay a great bank of cloud, dense, gray and massive, the specter of the coming snow-storm. There it lay, so huge and fantastically human, ruffling itself up, as fowls do, in defense against the cold. Halfdan walked on at a brisk rate—strange to say, all the street-cars he met went the wrong way—startling every now and then some precious memory, some words or look or gesture of Edith which had hovered long over these scenes, waiting for his recognition. There was the great jewel-store where Edith had taken him so often to consult his taste whenever a friend of hers was to be married. It was there that they had had an amicable quarrel over that bronze statue of Faust which she had found beautiful, while he, with a rudeness which seemed now quite incomprehensible, had insisted that it was not. And when he had failed to convince her, she had given him her hand in token of reconciliation—and Edith had a wonderful way of giving her hand, which made any one feel that it was a peculiar privilege to press it—and they had walked out arm in arm into the animated, gas-lighted streets, with a delicious sense of snugness and security, being all the more closely united for their quarrel. Here, farther up the avenue, they had once been to a party, and he had danced for the first time in his life with Edith. Here was Delmonico's, where they had had such fascinating luncheons together; where she had got a stain on her dress and he had been forced to observe that her dress was then not really a part of herself, since it was a thing that could be stained. Her dress had always seemed to him something absolute and final, exalted above criticism, incapable of improvement.

As I have said, Halfdan walked briskly up the avenue, and it was something after eleven when he reached the house which he sought. The great cloud-bank in the north had then begun to expand and stretched its long misty arms eastward and westward over the heavens. The windows on the ground floor were dark, but the sleeping apartments in the upper stories were lighted. In Edith's room the inside shutters were closed, but one of the windows was a little down at the top. And as he stood gazing with tremulous happiness up to that window, a stanza from Heine which he and Edith had often read together, came into his head. It was the story of the youth who goes to the Madonna at Kevlar and brings her as a votive offering a heart of wax, that she may heal him of his love and his sorrow.

"I bring this waxen image,
The image of my heart,
Heal thou my bitter sorrow,
And cure my deadly smart!" [*Exotics.*

Then came the thought that for him, too, as for the poor youth of Cologne, there was healing only in death. And still in this moment he was so near Edith, should see her perhaps, and the joy at this was stronger than all else, stronger even than death. So he sat down beside the steps of the mansion opposite, where there was some shelter from the wind, and waited patiently till Edith should close her window. He was cold, perhaps; but, if so, he hardly knew it, for the near joy of seeing her throbbed warmly in his veins. Ah, there—the blinds were thrown open. Edith, in all the lithe magnificence of her wonderful form, stood out clear and beautiful against the light within; she pushed up the lower window in order to reach the upper one, and for a moment leaned out over the sill. Once more her wondrous profile traced itself in strong relief against outer gloom. There came a cry from the street below—a feeble, involuntary one, but still distinctly audible. Edith peered anxiously out into the darkness, but the darkness had grown denser and she could see nothing. The window was fastened, the shutters closed, and the broad pathway of light which she had flung out upon the night had vanished.

Halfdan closed his eyes, trying to retain the happy vision. Yes, there she stood still, and there was a heavenly smile upon her lips—ugh, he shivered—the snow swept in wild whirl up the street. He wrapped his plaid more closely about him and strained his eyes to catch one more glimpse of the beloved Edith. Ah, yes; there she was again, she came nearer and nearer, and she touched his cheek, gently, wartily, smiling all the while with a strange, wistful smile, which was surely not Edith's. There—she bent over him; touched him again—how cold her hands were! The touch chilled him to the heart. The snow had now begun to fall in large scattered flakes, whirling fitfully through the air, following every chance gust of wind, but still falling, falling, and covering the earth with its white, death-like shroud.

But surely—there was Edith again—how wonderful!—in a long, snow-white robe, grave and gracious, still with the wistful smile on her lips. See, she beckons to him with her hand and he rises to follow, but something heavy clings to his feet and he cannot stir from the spot. He tries to cry for help, but he cannot—can only stretch out his hands to her and feel very unhappy because he cannot follow her. But now she pauses in her flight, turns about, and he sees that she wears a myrtle garland in her hair like a bride. She comes toward him, her countenance all radiant with love and happiness, and she stoops down over him and speaks:

"Come—they are waiting for us. I will follow thee in life and in death, wherever thou goest. Come," repeats Edith, "they have long been waiting. They are all here."

And he imagines he knows who they all are, although he has never heard of them, nor can he recall their names.

"But—but," he stammers, "I—I—am a foreigner."

It appeared then that for some reason this was an insurmountable objection. And Edith's happiness dies out of her beautiful face and she turns away weeping.

"Edith, beloved!"

Then she is once more at his side.

"Thou art no more a foreigner to me, beloved. Whatever thou art, I am."

And she presses her lips to his—it was the sweetest kiss of his life—the kiss of death.

The next morning, as Edith, after having put the last touch to her toilet, threw the shutters open, a great glare of sun-smitten snow burst upon her, and for the moment blinded her eyes. On the sidewalk opposite half a dozen men with snow-shovels in their hands and a couple of policemen had congregated and, judging by their manner, were discussing some object of interest. Presently they were joined by her father, who had just finished his breakfast and was on his way to the office. Now he stooped down and gazed at something half concealed in the snow; then suddenly started back and as she caught a glimpse of his face, she saw that it was ghastly white. A terrible foreboding seized her. She threw a shawl about her shoulders and rushed down-stairs. In the hall she was met by her father, who was just entering, followed by four men carrying something between them. She well knew what it was. She would fain have turned away, but she could not; grasping her father's arm and pressing it hard, she gazed with blank, frightened eyes at the white face, the lines of which Death had so strangely emphasized. The snow-flakes which hung in his hair had touched him with their sudden age, as if to bridge the gulf between youth and death. And still he was beautiful—the clear brow, the peaceful, happy indolence, the frozen smile which death had perpetuated. Smiling, he had departed from the earth which had no place for him and smiling entered the realm where, among the many mansions, there is, perhaps, also one for a gentle, simple-hearted enthusiast.—*Hjalmar Hjorth Boyesen, in Scribner's Monthly.*

THE JEWS.

A PAMPHLET just issued contains some interesting statistics—estimates perhaps would be a better word—concerning the Jews. The author (the Rev. J. Miller) places their total number at 7,074,858, namely:—In Europe, 5,226,858; In Asia, 591,000; In Africa, 792,000; In America, 450,000; In the British colonies, 15,000. Russia contains a Jewish population of 2,647,036; Austria, 1,300,000; Germany, 512,171; Roumania, 255,000; Turkey, 200,000; France, 95,000; England, 70,000—of whom 30,000 are residents of London; Holland, 68,892; Italy, 53,000. In Norway, Spain and Portugal, the total Hebrew population is set down at less than five hundred. The Jewish race still preserves its remarkable vitality. In Austrian Galicia, where there are now 500,000 Israelites, the increase during the semi-century from 1821 to 1870, according to the tables of Joseph Hain, has been 150 per cent., while the ordinary population only increased during the same period 25 per cent. Mr. Miller places the Hebrew population of New York at 80,000 and that of Chicago at 30,000. He might (says the New York World) profitably have commented on the fact that many Americans of Jewish descent are classified as Americans, and that there is a tendency among the young Hebrews to make less prominent the badges of difference between themselves and their Christian brethren—a tendency notably exhibited in the abandonment or modification of the most characteristic Jewish names.

THE LITTLE THINGS.

HEARTS, like doors, can ope with ease
To very, very little keys;
And don't forget that they are these,
"I thank you sir," and, "If you please."

Then let us watch those little things,
And so respect each other,
That not a word, or look, or tone,
May wound a friend or brother.

The Literary World.

RECENT LITERATURE.

Books for Holliday Presents.

Snip and Whip. By ELIZABETH A. DAVIS. Boston: Lee & Shepard.

THE adventures and mishaps of the two young gentleman, nick-named as above, form the staple of a pleasant story. The author has evidently been among children and knows their ways, as her pictures are so true to life. Such books as this one are the sort to put into the hands of our youth at this holiday season and few are better for that purpose than "Snip and Whip."

The Young Trail Hunters. By SAMUEL WOODWORTH COZZENS. Boston: Lee & Shepard.

FOR exciting life on the Plains and thrilling adventures, commend this work. The parts borne respectively by the two boys, HAL and NED, who formed part of a trading party, are none the less interesting by reason of their boyish blunders. The free-and-easy style of life, with its strong lights and shades, is just the sort of matter with which to make a boy's book, and the author has used it liberally.

Edina. By Mrs. HENRY WOOD. Philadelphia: T. B. Peterson & Bros.

MRS. WOOD has written a number of novels, both of the sensational and of the quiet order, but few of them can compare with this one in interest. It contains, too, some bits of true nature. Those who are amused by the average modern fiction, would do well to spend an hour or so with Mrs. WOOD in "Edina."

COMING EVENTS.

OUR neighbor, the Spirit of the Times, is preparing a superb Christmas number. The editor, Mr. E. A. Buck, has been making extensive and expensive preparations for the issue of a Christmas number which is expected to eclipse anything of a like nature that has appeared in this country. It will be nearly three times the size of an ordinary number of the well-known Spirit, and will be artistically ten times stronger, although issued at the usual price. Wilkie Collins contributes a specially written story; E. L. Blanchard of Drury Lane Theater, writes the history of pantomime; Rev. Adirondack Murray contributes characteristically; John W. Forney tells anecdotes and reminiscences; "Devoted Yachtsman" will tell us about "Christmas at Home," and at the same time drop his *incognito*. The editor of The Spirit having caught "Devoted Yachtsman" with his visor up, will publish his portrait. Ostrom of Cornell, tells about boating—indeed, every branch of sport will be illuminated. The illustrations will comprise 100 portraits of men and women who are famous either in sport or at the play, riflemen, oarsmen, and the lights of the English, French and American boards.

THE INQUIRER appears under date of December 7, in place of The Liberal Christian. The form taken is nearly that of The Churchman, and the appearance of the paper is much more attractive than that of its predecessor. The publishers state that very valuable additions have been made to the contributing force, and the columns bear witness to the fact in the merit of the matter presented in the first number.

PAYNE'S SUNDAY PRESS of Jersey City, is the latest enterprise of that irrepressible young journalist, Mr. SETH WILBUR PAYNE. It is bright, well made up, and altogether an acquisition to the Sunday reading of the Jerseyman.

Sabbath Reading.

THE LORD'S PRAYER.

OUR Father—
By right of creation,
By bountiful provision,
By gracious adoption;
Who art in heaven—
The throne of thy glory,
The portion of thy children,
The temple of thy angels,
Hallowed by thy name—
By the thoughts of our hearts,
By the words of our lips,
By the works of our hands.
Thy kingdom come—
Of Providence to defend us,
Of grace to refine us,
Of glory to crown us,
Thy will be done on earth as it is in heaven—
Towards us without resistance,
By us without compulsion,
Universally without exception,
Eternally without declension.
Give us this day our daily bread—
Of necessity for our bodies,
Of eternal life for our souls.
And forgive us our trespasses—
Against the commands of thy law,
Against the grace of thy gospel;
As we forgive those that trespass against us—
By defaming our characters,
By embezzling our property,
By abusing our person;
And lead us not into temptation, but deliver us from evil—
Of overwhelming afflictions,
Of worldly enticements,
Of Satan's devices,
Of error's seduction,
Of sinful affections;
For thine is the kingdom, the power and the glory forever—
Thy kingdom governs all,
Thy power subdues all,
Thy glory is above all.
Amen.
As it is in thy purpose,
So it is in thy promises,
So be it in our prayers,
So it shall be to thy praise.

[This paraphrase is credited to M. PIERRE BERNARD.]

DESTRUCTIVENESS OF SIN.

MEN think little of sin; but does God? What turned Adam and Eve out of Paradise? Sin. What drowned the old world in the flood? Sin. What destroyed God's own city and scattered her chosen people as vagrants over the face of the earth? Sin. What brought disease, accidents, toil, care, war, pestilence and famine into the world? Sin. What has converted the world into one great burying place of its inhabitants? Sin. What lighted the flames of hell? Sin. What crucified the Lord of life and glory? Sin. What, then, must sin be? Who but God, and what but his infinite mind, can conceive of its evil nature? Did you ever consider that it was only one sin that brought death and all our woes into the world? Do you not tremble at the thought that this evil is in you? Some will attempt to persuade you that sin is a trifle; that God does not take much account of it; that you need not give yourself much concern about it.

But what says God himself in his word, in his providence, in the torments of the damned, in the crucifixion of his Son? You have not only sin enough in yourself to deserve the bottomless pit and to sink you to it, unless it be pardoned; but sin enough, if it could be divided and distributed to others, to doom multitudes to perdition.—*J. A. James.*

LEGEND.

THIS word is a curious instance of the testimony such a word may bear against a whole system, of teaching or of practice. Of course every Latinist knows that in its most literal signification, "legend" means "something to be read." It was applied in the first instance to the things which were to be read in monasteries and nunneries, in the early days of Romanism. These readings were for the instruction especially of priests, and with a view to fit them for preaching to the people. They were *not* in the Bible, but in the lives of saints—those marvelous, often absurd stories, by which the Papacy has sought in all ages to justify its claim to miraculous gifts, and so to a special divine mission. These readings were called "legends" at first, because they were "readings;" but they in due time came to be called "legends" because they were such manifest and enormous lies. And the word so changed in its meaning continues to have that signification still.

THOUGHTS FOR THINKERS.

As we look to Christ in prayer and converse with him through his gospel, we shall find new and better dispositions growing up within us; holier habits of thought collecting and increasing—a power over sin that is an earnest of future triumphs—a pleasure in studying the divine dispensations and discovering fresh traces of wisdom and goodness—and an activity in every duty to God and man.—*Charles Wolf.*

A SHIP on the broad, boisterous and open ocean needeth no pilot. But it dare not venture alone on the placid bosom of a little river, lest it be wrecked by some hidden rock. Thus it is with life. 'Tis not in our open, exposed deeds that we need the still voice of the silent monitor, but in the small, secret, everyday acts of life, that conscience warns us to beware of the hidden shoals of what we deem too common to be dangerous.

Ladies' Portfolio.

A MODEL MAIDEN.

'Tis not alone that she is fair
And hath a wealth of golden hair;
'Tis not that she can play and sing,
To charm a critic or a king;
'Tis not that she is gentle, kind,
And wears no chignon huge, behind,
Nor high-heeled boot, nor corset laced
To show her slenderness of waist;
'Tis not that she can talk with ease
On well-nigh any theme you please;
'Tis not that she can row, and ride,
And do a dozen things beside;
The reasons why I love Miss Brown
Are that she never wears a frown,
Ne'er sulks, or pouts, or mopes, or frets,
Or fusses about "styles" or "sets;"
Ne'er nurses lapdogs by the fire,
Nor bids her friends her charms admire;
Ne'er bets upon the Derby Day,
And when she's lost omits to pay;
By bonnets does not bound her talk,
And is not indisposed to walk;
Ne'er bullies her small brothers, nor
Esteems their childish games a bore;
With pigments ne'er her cheek deniles
Nor practices coquettish wiles;
Needs not a maid to pack her things,
Nor plagues papa for diamond rings.
On biscuits is content to lunch;
Loves Shakspeare, Milton, Pope and Punch,
Never descends to vulgar slang,
And ne'er was known the door to bang?

[*Punch.*

FOR THE THOUGHTLESS.

We have probably all of us met with instances in which a word heedlessly spoken against the reputation of a woman has been magnified by malicious minds, until the cloud has become dark enough to overshadow her whole existence. To those who are accustomed—not necessarily from bad motives, but from thoughtlessness—to speak lightly of woman, we recommend these hints as worthy of consideration.

Never use a lady's name in an improper place, at an improper time or in mixed company. Never make assertions about her you think are untrue, or allusions that you feel she herself would blush to hear. When you meet with men who do not scruple to make use of a woman's name in a reckless and unprincipled manner, shun them, for they are the worst members of the community—men lost to every sense of honor, every feeling of humanity. Many a good and worthy woman's character has been forever ruined, and her heart broken, by a lie. A slander is soon propagated, and the smallest thing derogatory to a woman's character will fly on the wings of the wind, and magnify as it circulates, until its monstrous weight crushes the poor unconscious victim.

Respect the name of woman, for your mother and sisters are women, and as you would have their fair name untarnished and their lives unembittered by the slanderer's biting tongue, heed the ill that your own words may bring upon the mother, the sister or the wife of some fellow creature. E. D.

ANOTHER RICHMOND IN THE FIELD.

So, MAY MAPLE, your ideal of a housekeeper is one who used a mattress for forty years without washing it. And you call that mattress clean! Well, it is, after the manner of the Pharisees. A microscopic examination of the interior of it wouldn't reveal "ravening wolves," but the revelations would be of such a character as to make you regret your adherence to the forty-year rule. Did you ever calculate just about the amount of impurities thrown off from the human body during the night? If you haven't, I would recommend you to do so; and bearing in mind the fact that cottons and woolens are porous, and communicate a part of what they receive, you can form an idea of just how *clean* that aged mattress was. I certainly agree that to put a mattress out "to grass," exposed to rain, snow and dust, is a filthy proceeding, but must it be cleansed in so eccentric a fashion? Why not take out the filling (which should never be either hair or feathers), throw it away, treat the ticking to an orthodox wash, boil and dry, then refill it with fresh material? What would MAY MAPLE say to being advised to wear cotton garments next her skin, so as to keep her flannels *clean for forty years?* And yet that's just the sort of cleanliness she advocates in the matter of bedding.

And now, Mr. Editor, permit me to ask what medical authority is responsible for the following enlightened opinion, which appeared in RURAL of Oct. 21st, in reply to a question about "flesh worms?" "They arise from impurity of the blood or system." I've a suspicion the *devil* set that up while you were napping. Am I right?

FREE LANCE.

QUIET GIRLS.

It would be affectation to pretend that admiration, when it is openly expressed, is not very sweet to girls. Extremely few people are above the influence of vanity, and maidens, as a class, are certainly not among those who are. There is no valid reason why they should be condemned upon this account. To wish to be thought well of is a perfectly laudable ambition; indeed, it is to be feared that if most persons did not desire to be held in favorable estimation the world would be a very much worse place than it is.

The misfortune is that many well-meaning individuals mistake notoriety for admiration, and in so doing are naturally led to indulge in excesses and follies of various kinds. It is to be regretted that this is particularly true so far as regards a number of girls who, lacking knowledge of the world, and an insight into human nature, are contaminated when they are thrown into association with young men and women of a certain order. You will see them, in their desire to attract notice, unsteadily balancing themselves upon the line which separates the polite from the impolite, and coquetting with what public opinion has decided to be naughty. No doubt their intentions are in most cases perfectly innocent, and if they were not applauded by unprincipled flatterers, who, being tinged with badness themselves, like to make others the same, they would not continue to indulge in their little indiscretions. Unhappily, they are encouraged to believe that they are favorably distinguishing themselves when they are outraging good taste.

There are men who like a girl who talks at a great rate, and indulges in those descriptions of sneering and backbiting which are often mistaken for wit. There are conceited snobs who love a young woman ten times as much as they would otherwise do if they see that she treats those whom she does not deem it politic to conciliate with something very much resembling insolence. There are beaux who appreciate the creature who is everlastingly giggling, smirking, posing herself in what she deems picturesque attitudes, and shouting utter nonsense at the top of her voice. Quiet girls see this. They perceive, further, that because they seem to lack what seem to be supposed to be accomplishments, but which are really social vices, they are ignored. Over and over again are the sweetest natured as well as the cleverest women stigmatized as dull, stupid and prim, because they are disinclined to shriek and to show all the teeth in their head to the first man who philanthropically condescends to indicate that he is disposed to look with favor upon them.

CONCERNING MUSIC.

"Music hath charms to soothe the savage breast." That may be so, but if I were a savage I should have some choice in the music. Suppose some talented young miss, who has run up and down the scale a few times, and considers herself equal to the occasion, bangs upon the piano for an hour in your hearing, don't you think you will need soothing? Or if it comes to you on the Sabbath, in the form of congregational singing, where some are screaming in one key, and some in another, and only two or three know how to sing,—what about the soothing then? Perhaps you have sometime sat down to read and enjoy a little leisure, and had a hand organ begin to grind under your window until it has ground your nerves to a pomace. Is that soothing? I tell you "circumstances alter cases." Everybody cannot sing, any more than everybody can write or preach. Music hath charms, but it must be the right kind. Good, soul-inspiring music may sooth a savage, but from poor, squeaking music deliver us.

Cayuga. AMELIA.

ABOUT DRESS.

THE choice of colors is one that requires some thought and experience. The brilliant shades that were fashionable at one time, faded very rapidly. The darker ones now worn, even in summer, are much more durable. Black, brown and dark green are, perhaps, the most economical colors for dresses; lavender, and some shades of gray, the least so. Navy-blue wears well in good materials; in cheap fabrics it soon begins to look grayish. The bluer shades of prune are durable, but the redder tints soon become hard and disagreeable. Cream-color is rather more economical than white, though in large towns the sweets observe a strict impartiality towards both. In buying materials for making or trimming bonnets or hats, the very best must always be chosen. A good felt hat may be worn for two winters, whereas a cheap one betrays itself in two months. It is not necessary to buy silk velvet at five dollars a yard, but it should not cost less than three dollars. If lace be used it should be good, though it need not be real.

A CENTENNIAL INCIDENT.

AN esteemed contributor, visiting the Centennial, saw and sends us the following incident:

An old lady from Brooklyn was my companion. She was tall, stout, self-complacent. The talk before leaving home had been largely of STOKES, who was to be liberated from Auburn soon. We had seen a good many *models* on our way, and coming to the elevator in the center of the building, over which were the letters, "STOKES & PARVISH," she looked at the man sealed in the elevator and then at the words, and being a little near-sighted, said, with a satisfied air, "Ah, STOKES' *prison*—a model, I suppose!"

I suffered, but did not laugh.

GOOD ADVICE TO A YOUNG LADY.—Live always in the best company when you read. No one in youth thinks on the value of time. Do you ever reflect how you pass your life? If you live to 72—which I hope you may—your life is spent in the following manner: An hour a day is three years; this makes twenty-seven years' sleeping—nine years' dressing—nine years at table—six years playing with children—nine years' walking, drawling and visiting—six years' shopping, and three years' quarreling.—*Sydney Smith.*

THE less indulgence one has for one's self, the more one may have for others.

Reading for the Young.

JINGLES.

"DAUGHTER, daughter,
Mind the water!"
She said she never should,
So she went in,
Right up to her chin,
And did not find it good;

For the water was bitter,
And made her twitter,
As nobody thought she could!
She cried in haste,
"What a nasty taste!
I wish I had understood!"

Oh, send and save her!
A beautiful flavor
Is not to be found in the flood;
And coffee or tea
Is the drink for me
At a picnic in the wood!

EXPOSITION NOTES.

IT IS of no use! I have drawn my forehead into scowls, and plunged my hands into the depths of my wig till each separate hair, in a state of rebellion, bids fair to rival the cranium of THADDEUS. I have been studying the little book devoted to Centennial memoranda, and have decided if I ever wrote those lines some evil genius controlled the pencil. It is a very convenient little book to refer to, because it can be read bottom side up almost as easily as the other way, and it makes no particular difference where you begin. Uncle FRITZ picked it up the other day, and I overheard him saying to himself (after turning it round and round, in a vain attempt to find the top), "It is kinder dim, but PET is gettin' along first-rate. She used to make her lines so crooked; these air tollable straight. Wonder what she was tryin' to make, anyhow—pictures or words." The idea! I suppose it was indignation that prevented my enlightening him, yet I must confess it does bear a striking resemblance to PET'S "tomishun book." Who cares for note-books and Egyptian characters, we will make our way between the vehicles toward Machinery Hall. Inside all is dust, confusion and noise. It is like the first of May in New York. Trucks, cars, carts are busy loading and moving—hurrying as if they expected the building to be torn down within an hour. We have said good-by to the huge engine. The last cheer in honor of the maker has died out, and even the clanging of bells, rattling of steel, iron, tin pans, cups, &c., has subsided. The great Exhibition is closed, and everybody sighs and goes home to rest. No, not every one, for here and there, dodging workmen and vehicles, may be seen a venturesome visitor who, prevented from seeing the Exposition in its glory, is determined to get a peep at what remains.

Gloucester, Mass., made a complete display of shipping, seamen's suits, &c. In front was "The identical suit worn by BOYTON when he swam the English Channel." What a crowd at all hours around the Type Writers! Some watching the piano-like movement, others superintending the printing of a note to their "heart's best affection," whether the mother-in-law or grandfather's cousin. The air was fragrant with popping corn, and wondering how so many could be supplied, we stepped down a short distance, and, peeping between the heads and shoulders of the crowd, watched the five rapid operatives popping, gathering, balling and wrapping in papers. Another place we visited several times, vainly hoping to learn more about the manufacture of wall paper, but the machine attracted such a crowd that it was almost impossible to see the most important parts. How many saw the Westinghouse Air Brake, and the balls supported in mid-air at all sorts of angles, and listened to the queries of the bystanders? "What keeps them there? What are they made of? Why don't they fall?"

We are so near the annex of wood-sawing and turning machinery let's go there. No, we will give it up; there is too much noise and dust, and we shall be in the way of packers. Even the "Mohawk Dutchman" has folded his robes about him and silently taken his departure. We are too late to see his crown and eye-glasses—the remarkable jewelry, chatelaine and huge fan of wood. We would like to hear him repeat those stale jokes again as he helped himself to tobacco with a pair of sugar-tongs of his "own manufacture," and see him saw from one block furniture enough to set up a young couple in house-keeping. We felt grateful, too, for the names of each piece, as without the description we would have been unable to say what most of them resembled.

Passing the Willimantic space we noticed quite a good imitation of our bald eagle, made of 8,464 spools of thread—the colors delicately arranged. The Domestic had a life-like group, "Red Ridinghood," and the Weed a vast piece of machine embroidery, representing the Battle of Bunker Hill; 8,640,000 stitches said to have been used. Who counted them? We must not forget the old Franklin press, that has been worked all through the Exposition, and is to be sent back to its place in the Patent Office. Of equal interest is the Ephrata press, 130 years old, on which was printed the Declaration of Independence, and Continental money. We rush by neat models of yachts, schooners, tugs, &c., among them the "City of Berlin," said to be the largest English merchant steamer afloat. How the looms attracted, especially those weaving silk handkerchiefs, ties, bookmarks, etc. There were two in Machinery Hall—one from New Jersey, the other from Coventry, Eng. On our way out we pass the monster sugar-cane mill from Glasgow. What a grand hash machine it would make! It wouldn't do to use it in the Indies, however, for the natives have a careless way of hanging over the vats that, if tried with this machine, might cause a decrease in population.

On our way to the Women's Pavilion we stopped to gaze at a fragment of the "Statue of Liberty," intended to be erected in New York harbor. We have only the forearm and hand holding the flambeau, and get but a faint idea of its colossal size. Subscribers were allowed inside, and could get a fair view from the top. The light of the statue, from soil to top of flambeau, will be 220 feet. We were so near Cook's Ticket Office that we went in again to see the mummy. The crowd had pressed against the side of the glass case, in their eagerness to view the remains, till it was crushed in. It would be far more useful to have our bones cleaned and nicely wired up in some medical institute, no doubt. But most of us have a fondness for Mother Earth and the gradual regression to dust. For fear they will be preparing us in that horribly idiotic manner, four or five centuries from now, bringing us up for the rising generation to stare at, let's all be cremated. The mummy was an Egyptian princess in the age of the PHARAOHS, thus making her 3,000 years old. Some one said she was a maiden lady, and had made her appearance after long years of seclusion, to aid the women's suffrage cause. Another said she belonged to the class of patient wives who had worn herself to skin and bone sitting up for the ever-late husband, and was exhibited as a model of patience and devotion. Hurrah for the Princess! May her shadow never grow less.

The children, at least, will not forget the Norwegian department in the Women's Pavilion. So much of the needle-work represented childish scenes; and there were whole sets of dainty furniture, and accompanying ornaments for doll houses. Spain and her colonies made a large and handsome display. The needle-work was exquisite, its effect lightened by the rich materials. I noticed particularly a portrait of King ALFONSO in silk; and a priest's vestment of yellow silk, embroidered with gold thread, and thickly studded with jewels—the work of three girls, two of them twelve, one thirteen years of age, belonging to the charity school. More needle-work portraits were those of the Prince and Princess of Wales; WASHINGTON, in worsted and beads; death of DOUGLASS at the Battle of Langside, in defense of MARY, Queen of Scotts. Somewhere I noticed an article in which the writer spoke of the women's exhibit being "all needle-work and fancy articles, for which they have always been noted." To whom did he give credit for the numerous labor-saving inventions scattered about the building? To be sure, some of them were so small as to escape notice if a person was in a hurry, but their size made them none the less useful.

If my article was not already so long I would mention a few, but I want to just call your attention to the carvings, which were numerous and of handsome design. A bedstead, piano and organ were especially admired. The lady who prepared the case of skeleton leaves and ferns must have taken Patience and Perseverance for her motto. They are delicately, beautifully perfect!

I think it is too bad, when I have said so little, that the Editor must look at me meaning, "You had better sit down and let somebody else speak." We will come again, before everything is packed up, will we not? C. ESTELLE PEIRCE.

"Aquadale."

LETTERS FROM BOYS AND GIRLS.

A Suggestion and Question.

DEAR RURAL COUSINS:—As the Editor was kind enough to print the letter I wrote some weeks ago, I flatter myself that I am now one of "the Cousins." I would ask YOUNG TEACHER of Nov. 18th (being one of the same profession), if she don't think it would be a good plan to ask one another questions in some subject, say Geography or History, if every one would take part in it, both in answering and asking questions? For my part, I think the subject of piecing quilts quite exhausted; and as for the boys writing better essays than the girls, they think they can do everything better, and we will have to treat them as if they were little children, giving them much praise or they will not write at all; but, girls, we can work on patiently, and will be able to "reap the fruits hereafter." Now for a question: Where and what is the hottest town in America? I hope to see lots of answers and more questions in the next issue.—D. B., *Aylmer, Canada.*

From a Granddaughter.

DEAR COUSINS:—I have a chance to read your letters every week, for my grandfather takes the RURAL, and I hope he will continue to take it. If he did not I should miss it very much. It is a long while since I have written to you, but I have been busy at school. As it is rainy to-day and I cannot go, I thought I would write. As you have not all been to the Centennial, I will tell you about some of the things that interested me most. In the Women's Pavilion there was a head made of butter. It had curls and looked like a human head, only it was not the right color. In the Main Building I saw the smallest watch ever made. I saw some wax figures from Sweden; they were in groups. In the Kansas Building were a number of stuffed animals which really looked life-like. Hoping Uncle TRUE will write soon, I close.—MINNIE, *Leonardville, N. J.*

A Request.

DEAR FRIENDS:—May not I call you Cousins? I have been waiting a long time outside of the

magic circle, longing to join you, and yet hardly daring to ask to be admitted. I listened to all the talk about YOUNG TOM and the rest of the boys, till my tongue fairly *ached* to join in. YOUNG EDITOR seemed in haste, when he called the other day. He should have told us the name of his "sprightly" little sheet, and some of us might have sent a subscription, if it is so *very* nice. You should not be conceited, Y. E. How many of the Cousins have been to the Centennial, or is that too old a subject? I very unexpectedly had a chance to go, and concluded that I should never have another such opportunity; so one pleasant day in September I found myself looking at the beautiful things to be seen there. But I shall not *try* to tell anything about what I saw. If Uncle TRUE has a mind, he can tell you much better about it than I. Will Miss LOW, when she writes again, please tell me the date of the paper in which she saw ROB ROY'S letter? Having been away all summer I have not seen all the RURALS, and having a fancy for reading R. R.'s letter, I make the above request. I bid you "Good night," and take my departure, hoping to secure an invitation to call again.—ALICE.

[Uncle TRUE will be charmed to hear from ALICE again. ROB ROY'S letter can be found in RURAL of Aug. 26.]

Come Again.

DEAR COUSINS:—I see by the RURAL of Nov. 18 that LEWIS H. T. speaks against quilt piecing, as several others have done, but I do not agree with them at all. Well, Cousin ROSA I will send you the quilt patterns with pleasure; just send your address. Uncle TRUE, I thank you very much for printing my other letter, and if you will publish this I will not trouble you again soon.—MAMIE A. S., *Griffin, Ga.*

[Always glad to hear from my nieces.—UNCLE TRUE.]

Another Pleasant Visitor.

DEAR COUSINS:—I take much delight in reading the RURAL, and I thought as sister MAMIE was writing I would write some too, and see how Uncle TRUE and the Cousins would like me. I am a little girl, eleven years old, and live in the country. My papa is a miller. I have one brother and two sisters. I must say something on the quilt question, as I see it is common among the Cousins. I have pieced three—one when I was very small.—EDIE A. S., *Griffin, Ga.*

"If——."

DEAR COUSINS:—I have been thinking about writing a long while, and if this is put in the waste basket I am afraid I shall not try again. I am a New York farmer's girl, just thirteen years old. I read the RURAL every week. I have a good many pets, but I never heard of a blue cat! I like to piece quilts. I expect to commence school next week, if I don't have the whooping cough.—CLARA E. McP., *Fort Hill, N. Y.*

The Puzzler.

ILLUSTRATED REBUS.

☞ Answer in two weeks.

MISCELLANEOUS ENIGMA.

I AM composed of 42 letters:
My 14, 20, 11, 1, 23, 2, 24, 40, 39, 21 a city in one of the Southern States.
My 4, 13, 17, 35 a farm building.
My 16, 9, 22, 6, 2, 10, 7, 30, 5 a lady's name.
My 12, 26, 35, 33, 18, 15 a day of the week.
My 19, 3, 16, 9, 22, 32, 2 a man's name.
My 27, 15, 21, 21, 29, 1, 39, 22, 6, 38 pertaining to missions.
My 28, 34, 31, 42 a minute spider.
My 25, 37, 13, 41, 4, 20, 23 part of a house.
My 36, 9, 8, 28, 42 an aromatic plant.
My whole was said by Madame Roland.
☞ Answer in two weeks. S. C.

GEOGRAPHICAL ENIGMA.

I AM composed of 17 letters:
My 8, 15, 11, 10 a city in Guatemala.
My 7, 8, 12, 3, 10, 16 a city in Denmark.
My 16, 1, 6, 15, 10, 13 a city renowned of old.
My 5, 7, 10, 16 a city in Arabia.
My 2, 4, 15 a city in Further India.
My 16, 10, 14, 7, 17, 3 a city in Egypt.
My 5, 12, 7, 4, 10, 9, 3, 10 a city in the United States.
My whole is a Bible command.

PUZZLER ANSWERS.—Dec. 2.

ILLUSTRATED REBUS.—Dependent people are usually wanting in independent spirit.

ROMAN LETTER PUZZLES.—1, Dodo; 2, Cold; 3, Doll.

MISCELLANEOUS ENIGMA.—"My Native Land, Good Night."

PUBLISHER'S NOTICES.

TO THE LADY READERS OF THE RURAL.

SPECIAL OFFER OF RARE PLANTS AND SEEDS

HAVING a few choice plants now growing in the RURAL'S EXPERIMENTAL GROUNDS, which we think would be desirable to some of the lady readers of the RURAL NEW-YORKER, we make the following offer:

Those who, in renewing their own subscription, send us an additional name (not already on our list) with the sum of $4.00 for the two, may select any two of the following-named plants and a paper of the seed of the Molucca Balm. Those who receive these premiums can divide with their friends, or keep them all, as they may agree among themselves, as our object in making the offer is to induce old subscribers to send us new ones, thereby increasing our list. The plants and seeds offered are very choice, as will be seen in description given below. The plants will be sent by mail free, and carefully packed and forwarded immediately on receipt of subscriptions.

Abutilon Boule de Neige.—The best of the *Abutilons*. Its flowers are large and white. It blooms throughout the whole year and therefore is alike desirable for the conservatory and garden.

Marie Lemoine.—Among a hundred or more varieties of double-flowered *Pelargoniums*, new and old, this is yet unrivaled. The individual flower, of a delicate rose color, as well as the truss, are the largest of their class.

Hydrangea paniculata Grandiflora.—So much has been said of this new Japanese shrub during the past year that little need be added now. It begins blooming in early August, continuing until after hard frosts.

Variegated Ampelopsis or *Vitis heterophylla variegata.*—We do not hesitate to pronounce this one of the most attractive vines in cultivation. The leaves are deeply-lobed and variegated with white and green.

Jerusalem Artichoke.—Believing that the Jerusalem Artichokes are exceedingly valuable as food for all kinds of farm stock, we place them among our valuable premium plants. They will yield more bushels of tubers per acre than the common potato and we believe them more valuable for feeding purposes, besides the Artichoke will grow vigorously where the potato would fail entirely. We will send one-half pound each of the Long Purple and Round White, for each new subscriber as above, or one pound of the tubers of either variety. We shall store a quantity of the tubers in the cellar for sending out this winter; but those of our subscribers who reside north of the latitude of New York City had better leave their plant premiums in our hands after the first of January until early spring. We will, however, "book" all orders received during the winter, to be sent at the earliest possible moment.

Achania malvaviscus or Malvaviscus arboreus.—The flowers are bright red, of a turban shape, two inches long. It blooms incessantly whether indoors or out. In the conservatory it may be trained so as to cover wood-work as readily as a vine. Its growth is so rapid that small plants set out in the spring will cover a space four feet in diameter by fall. As a plant for the sitting-room, the little care it needs, its perpetual scarlet flowers, contrasting elegantly with its golden-green, plush-like leaves—its endurance of dry heat and dust render it most pleasing and satisfactory. We commend this plant with confidence.

Molucca laevis.—We will send, also, to ALL who are entitled to a choice of any two of the above plants, a package of the seeds of the beautiful Shell Flower, an account of which and an engraving were given in the RURAL of Aug. 17, p. 117.

TERMS FOR 1877, IN ADVANCE,

INCLUDING POSTAGE, WHICH PUBLISHERS PREPAY.

Single Copy, $2.50 per Year. To Clubs:—Five Copies, and one copy free to Agent or getter up of Club, for $11.25; Seven Copies, and one free, for $16.05; Ten Copies, and one free, $20—only $2 per copy. The above rates *include postage* (under the new law) to any part of the United States, and the American postage on all copies mailed to Canada. On papers mailed to Europe, by steamer, the postage will be 85 cents extra for each subscription. Drafts, Post-Office Money Orders and Registered Letters may be mailed at our risk. ☞ Liberal Premiums to all Club Agents who do not take free copies. Specimen Numbers, Show-Bills, &c., sent free.

News of the Week.

THE BROOKLYN THEATER HOLOCAUST.

THE destruction of the Brooklyn Theater on Tuesday night, Dec. 5, proves to be the most terrible calamity of its kind that has occurred in this country. What was first deemed to be an ordinary fire, naturally involving serious financial loss to the owners, the lessees and the actors, was really a catastrophe of the most heart-rending character, causing, as it did, the loss of 305 lives. No theater fire on this continent had so much horror lent to it. Even the Richmond Theater disaster was nothing in comparison to this latest evidence of the wicked carelessness and ignorance displayed in building places of public amusement.

At a moment when every eye was fixed on the painted scene and every ear strained on the utterances of the several characters, the dreadful cry of "Fire!" was raised, and in a few moments after the entire building was filled with flame and smoke, and hundreds of men, women and children were suffocated and burned to death, and their charred and disfigured remains buried beneath the ruins.

The play was the "Two Orphans" and had progressed to the last scene of the last act, when a voice whispered from the wings, "The theater is on fire; look behind, for God's sake." Notwithstanding this warning the play proceeded for a few moments longer, when the alarm was communicated to the audience. Behind there was a noise of shifting scenery. A panic was imminent. A cry of "Fire" was heard and the flames began to shoot out from the flies. The actors behaved with great presence of mind, and advancing to the front of the stage besought the audience to be calm.

For a moment the people sank back into their seats. "We are between you and the fire, sit still," said one of the actors, "for God's sake, sit still." It is wonderful that such an entreaty was listened to much less obeyed, but momentarily there was complete silence all over the house. The flames were rapidly extending and the scenery at the rear of the stage was all on fire. Still there was no rush, but, while one gentleman was calmly advising the audience to remain quietly in their places until their time came to pass out, another cried, "It is time to be out of this," and then the stampede began. The people in the dress circle and the multitude in the gallery began to rush down the stairways; escape for those above was rendered impossible, and a scene of horror was enacted which baffles the power of pen to picture.

An usher opened a door leading into an alley. Through this streamed that part of the audience which had been seated in the parquet and orchestra, and most of them escaped without much injury. Had they been compelled to make their exit at the ordinary entrance most would have shared the fate of the multitude which rushed panic-stricken down the stairway. Had it not been for an unused subterranean passage, probably the entire company would have lost their lives, as it was, two of the prominent actors perished.

The scene in the galleries was horrible. The crowd surged madly to the stairs, and were crowding down when a woman caught her foot and fell headlong, before she could make a motion to recover herself, those from above precipitated themselves on her, and in the briefest space the affrightened multitude were piled over her ten deep. This enormous weight shattered the stairs, and the entire mass of crushed humanity was thrown on the floor below, which in its turn giving way precipitated them into the cellar, where they were presently covered and overwhelmed with the burning fragments of the interior of the theater. Thus was entrapped an entire audience who were suffocated, wounded, and burned to death in sight of a multitude of helpless on-lookers, who at first seemed to be entirely unaware of the extent of the catastrophy, so sudden and terrific was the whole scene.

In exactly twenty-five minutes from the time the forked flame of fire shot out from the broken light in the flies the walls fell in, and all was over. Notwithstanding the excitement and alarm and anxiety, the full scope of the disaster was not even imagined. It was only in the morning, when the dead began to be unearthed, that the calamity was revealed in all its awful immensity.

Through the ashes and wreck protruded arms and limbs, half burned heads and pieces of clothing in every direction. When every obstacle was removed from the surface of the dead and around them, they were found tier upon tier, fifteen feet deep, packed one above the other. Heavy clouds of steam arose from the terrible holocaust. The spot wherein these unfortunate beings were killed was about fifty feet long, twenty feet wide and a full story deep. They had fallen on the ground floor from the upper story, and the fire had burned through them to the basement, into which the smoldering mass of flesh and bone had settled when the flooring was eaten from under it. And so they were found, burned to cinders, out of all their former semblance, blackened and nude for the most part, and disfigured in the most frightful manner.

There was a strange similarity between all the corpses. Their nether limbs, arms and heads were almost invariably burned off, and their trunks looked like shriveled sole leather. Some of these upper tier bodies were without a shred of clothing; others had lost only the backs of their garments; the fronts were sound, but stuck to their persons.

The bodies, as fast as found, were sent to the morgue and placed in rows awaiting identification. In most instances, this will be an impossible task, owing to the utter disfigurement of what were once men and women. The scenes about the morgue were heart-rending, as may well be imagined.

The disaster has plunged the community into the most profound gloom. Investigation has shown that the theatre was totally unprovided with means to extinguish a fire, there being but one hydrant on the premises. The number of lives lost is estimated, the probability being that our figures are short of the actual number. Relief and subscriptions are pouring into the hands of the committees appointed to recive them, and steps are being taken to bury the unrecognized in one large grave in Greenwood Cemetery, in a manner that will fitly close the last scene of the saddest and most terrible tragedy that has convulsed this community in years.

HOME NEWS PARAGRAPHS.

THE Secretary of War, in his annual report, says the short space of time that has elapsed since he entered upon his present duties has barely sufficed to familiarize him with the affairs of the department. He therefore confines himself to a summary of the reports of the general of the army and chiefs of the various bureaus.

The Postmaster-General thinks that the Post-Office will be self-sustaining when the country becomes more populous.

Baron von Palm was successfully cremated at Washington, Pa., but the ceremonies were not such as to make that mode of disposing of the dead popular with the masses.

The President's Message proved a dry bundle of sticks, and disappointed everybody. In the Senate the reading was listened to with a show of attention; but in the House, after the first few paragraphs, the New York papers, which had just arrived, seemed to be considered by most members as the more important public documents. In the message the President again refers to Santo Domingo.

The House has sent Investigating Committees to South Carolina, Florida and Louisiana.

The report of the Secretary of the Navy shows that there are now belonging to the navy 146 vessels of 150,157 tons measurement. Exclusive of howitzers and Gatling guns they carry 1,142 guns; of these, 123 carrying 913 guns, with a measurement of 120,893 tons, have steam power, and 24, carrying nominally 229 guns, are sailing vessels. In 1869 there were 203 vessels. Of these there have been sold, 46; broken up, 13; lost at sea, 5, making 69 vessels, thus reducing the number to 134 vessels; to which add new vessels, 10; purchased vessels, 2, thus making the whole number on the register at the present time 146 vessels. Of our present force of every class, 40 are built of iron, namely: 5 double-turreted iron-clads, 15 single-turreted monitors, 2 torpedo boats, and 18 steamers of various classes. Of the remainder, 65 are of live oak, namely: one iron-clad, five steamers of the first rate, 20 steamers of the second rate, 19 steamers of the third rate, and 20 sailing vessels. The remaining 41 are white oak ships, of almost every class. Of the whole number 75 are in actual service and four are preparing for sea. Seventeen of our steamers have been furnished with compound engines and boilers of the best class and with the latest improvements, and nearly all our other steamers have, during the last eight years, been supplied with new boilers and their machinery extensively repaired.

There were 940 deaths in Savannah from yellow fever during the four months ending Nov. 26. The total number of deaths during that period was 1,574—a ghastly record.

The fire in New Orleans, Dec. 1, destroyed 112 houses. The loss is estimated at between $300,000 and $400,000; insurance, $200,000. About 50 of the houses were occupied by 100 families, who lost nearly all their effects and are left destitute, many of them losing their wearing apparel.

Extensive preparations are being made for the celebration of the Battle of Trenton, at Trenton, N. J., Dec. 26th. There is to be a sham battle.

The gold yield of California this year will be about $20,000,000.

There is a stampede of gold hunters from Deadwood and Custer City in the Black Hills to Wolf Mauntain, where rich deposits are said to have been struck.

FOREIGN NOTES.

THE London Daily News of the 9th inst. editorially draws attention to the fact that Cardinal Simeoni, the successor of Cardinal Antonelli, who was elevated to the dignity of a Prince of the Church on the occasion of his appointment as Papal Nuncio to the King of Spain, signalized his arrival in that country by issuing a protest against the law of religious liberty, which the revolution had established in Spain, and demanded the restoration of the Concordat of 1851, whose fundamental principle required "the exclusion of every other creed." He was especially apprehensive of the results of a system of education which was not absolutely under priestly control. Simeoni's circular was so violent that the liberal journals at the time advised that his passport should be given him at once, and a mob burned the obnoxious Concordat of 1851 before his residence in Madrid.

No more Sunday trains in Canada. The Dominion Government has issued orders that no trains shall be run on the Sabbath day except in case of great emergency, and then only on direct order of the Government.

A despatch from Belgrade says the Sclavonian committees in Russia have notified their representatives in Servia to cease getting passports and furnishing money to enable Russian officers to leave Servia, as all those absent on furlough will return to Servia immediately.

A battle was fought at Huamantla between the Mexican government forces, and those of Gen. Diaz, resulting in a victory for the latter. Diaz entered the City of Mexico, and demanded a loan of $500,000. President Lerdo has been captured. Meantime Iglesias has fallen out with Diaz on account of an unequal division of offices, and there are at present two governments in Mexico. The first installment of the claim due the U. S. ($300,000) awarded by the Mixed Commission will not be paid for lack of funds.

Bismarck says Germany and Russia will remain on the most friendly footing.

The English government by arresting Brent, tacitly acknowledges a false position, and the former extradition treaty, it is said, will be put in operation.

Russia continues to prepare for war.

A natural result of diminishing the emoluments

of the Church of England has been that the clever young men seek more lucrative careers. In the Church of Rome celibacy makes priests comparatively indifferent to pecuniary considerations, but in the Church of England a man, even though inclined to the ministry, hesitates at entering a profession in which he might barely be able to maintain his wife and children. Thus livings in the gift of the colleges, to which fellows of colleges have the presumptive claim, in order of seniority, have often of late gone a begging. The fellows don't take orders nowadays.

The Rev. W. M. Statham says in the London Quiver that, though not a teetotaler, he is an earnest temperance man, and it staggers him to think that the British public has in eight years drunk liquor to the value of £800,000,000, which is more than the national debt. So unpopular, he says, is the subject, that "the leading writers of England touch very tenderly on this dark spot in the history of the most drunken nation under the sun. To take the very lowest ground, this expenditure is," he says, "extravagance, and leads to that mortgage of the morrow which robs men of their peace of heart. Extravagance means begging, borrowing, stealing, and it is seen on all sides."

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Dec. 9, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls.	107,160	Molasses	807
Whisky	2,234	Rice, bbls	21,346
Corn meal, bbls	4,036	Cut meats, pkgs	20,204
Corn meal, bags	1,288	Lard, pkgs	646
Wheat, bush	772,898	Tobacco, hhds	3,487
Corn, bush	220,233	do. pkgs	29,337
Oats, bush	273,041	Butter, pkgs	65,251
Rye, bush	93 173	Cheese, bxs	36,957
Malt, bush	19,340	Cotton, bales	5,281
Barley, bush	254,115	Rosin	685
Beans, bush	1,544	Spts. turp., bbls	2,159
Grass seed, bush	16,316	Dried Fruits, pkgs	5,823
Beef, pkgs	1,900	Eggs, bbls	3,319
Wool, bales	3,792	Peanuts, bags	70,185
Hops, bales	1,511	Leather, sides	1,187
Pork, bbls	10,200	Sugar, hhds	14,742
Tallow	1,561	Oil cake	

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible: mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival here of summer items on Saturday.

BEANS AND PEAS.—Exports beans past week, 1,036 bbls.; since Jan. 1, 54,930 do.: same time last year, 34,052 do.

The market is strong for beans of all kinds and although the stiffened quotations have had a tendency to check business, the stock is at present of such a concentrated or light character that holders feel confident that their views must be met. They have a reasonable basis for their firmness, as the weather is wintrish and local buyers will soon be forced to replenish. These remarks apply to all grades. Canadian Peas have a wide range which covers qualities.

Exports past week 25,986 bush.; since Jan. 1, 671,400 do.: same term last year, 409,900. Green peas have declined. B. E. peas firmer.

Beans—New medium, $2.20@2.25; do. marrow, $2.30@2.35; do. pea, $2.45@2.50; white kidney, $2.40@2.50; red do., $2.45@2.50; Old Beans—Medium, prime, $1.75@2.10; marrow, $1.80@2.20; pea, prime, $2.00@2 25; white kidney, prime, $2.00@2.20; red do., prime, $2.00@2.20; black, $3.00@3.25; Canadian peas, ₱ bbl., free, $1.12@1.15; do. bulk, 80@83c.; green do., new, $1.15@1.20; do., S. B. E. peas (2-bush. bag), $2.15@2.20.

BEESWAX.—There is a little freer supply and demand small; western quoted at 30-31, and Southern at 31-32.

BROOM CORN.—Demand continues unimportant while supplies are fair, and prices are irregular. Brush short green quoted at 7@8c. ₱ lb.; hurl green at 6½@7½c.; green medium at 5@6c.; red and red-tipped, 3@4c.

BUTTER.—We cannot yet record the presence of a good stork-using wholesale demand. Grocers report a light retail trade and for the moment their wants are moderate. For any speculative feeling prices are too high for State; especially as the shading of quality is very abrupt. Jobbers want the few fancy marks and lines for special trade while the bulky lots are too summery as a whole to be attractive. There is, however, a decided improvement in the weather and trade may take a start before the month is out. As is usual in a peddling season dealers are left with a good many bad ends of dairies and firkin remnants of this style are now an oppressive feature in the supply. A good many holders are willing to accept low figures for these unmarketable lots but buyers who want cheap stock for baking or common purposes have a good pile of Western to draw from at easier figures than are placed on State. The export trade is quiet again, and in the opinion of some it will not revive until after the holidays are over. Western butter has had a steady call for consumption when quality helped sales, but off-flavored lots are in buyers' favor. Fine rolls are scarce, our quotations are full for the average qualities. We make a few higher changes for the fancy lots of State.

Exports past week 930 pkgs.

We quote:—Choice pails, 34@36c.; prime, 32@33c.; poor to good, 24@29c.; creamery pails, choice, 36@38c.; good, 33@35c.; sweet cream pails, 30@35c. State firkins, choice, 29@30c.; fair to good, 25@27c.; do. half firkin tubs, choice, 33@35c.; fair to prime, 28@32c.; do. Welsh tubs, choice, 30@32c.; other, 24@28c.; Inferior State, 15@19c.; Western creamery, choice, 36@38c.; other, 32@34c.; do. firkins, best, 21@22c.; other, 16@18c.; dairy tubs, choice, 25@27c.; other, 18@21c.; factory choice, 22@24c.; other, 13@15c.

State dairies quotable at 30@32c. with fall tubs Welsh tubs, dairies, 26@29c.

State firkins dairies 25@30c. Roll butter, fair to prime, 18@22c.; do., poor, 14@17c.

CHEESE.—There has been only a moderately active market this week, yet prices have been well maintained. The arrivals are now falling off, and it is the impression that they will run moderate from this out. The shipments this week are made up to a very fair extent of parcels that have been bought in the interior, and coming through here on direct consignments abroad, some 10,000 in this way. The market may be regarded as strong throughout. Fancy-colored factories range from 14¼@15c.; while fancy white rarely exceed 14¼c., these for the September make; the later made are relatively low. A number of the purchases are of prime, late-made stock at 13¾@14c. The English market has been strong; but there appears no especial urgency to buy, the comparatively free purchases, made a week or two since, having evidently replenished assortments sufficiently on the other side for the Christmas trade.

Fancy factory at 14½@15c. for fancy colored, 13½c. for fancy white, job lots, 15½c.; good and prime, 13¾@14c.; fair, 11@12½c. State farm dairy, fancy, 13¾@13¾c.; good to prime, 12@13c.; fair and good, 11@12c. Western factory, fancy, 13¾@14c; good and prime, 12@13c.; fair lots, 10@11c.

Exports past week, 28,887. Cable quotation, 70s.

COTTON.—Exporters have been buying more freely and the demand from the mills is fair; prices are a little higher.

The latest quotations are:—December, 12 7-32@12¼c.; January, 12 13-32@12 7-16c.; February, 12 19 32@12¾c.; March, 12 25-32@12 13-16c.; April, 12 31-32c.; May, 13¼c.; June, 13 9-32c.; July, 13 15-32@13 7-16.; August, 13¾@13 17-32c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	10¾	t0¾	10¾	10¾
Strict ordinary	10⅞	10⅞	t0⅞	10⅞
Good ordinary	t1⅛	11⅛	11⅛	11⅛
Strict good do	t1⅜	t1⅜	11 7-16	11 7-16
Low middling	11⅝	11⅝	11¾	11¾
Strict low middling	11¾	t2	12⅛	12⅛
Middling	12⅛	12¼	t2 5-16	12 5-16
Good middling	12⅜	12⅜	12⅝	12⅝
Strict good middling	12⅝	12⅝	t2¾	t2¾
Middling fair	13	13⅛	t3⅛	13⅛
Fair	13¾	13¾	14	14

Stained

Good ordinary	10	Low middling	11
Strict ordinary	10¼	Middling	11½

DRIED FRUITS. For apples there is no improvement in demand, and the market was probably never in worse condition than at present, but even at the remarkably low prices it is almost impossible to sell even small lots. Peaches are yet scarce and at firm prices. Blackberries are hard to sell. We quote:

Apples—State, sliced, 5¼ @ 6c.; do., quarters, 5¼@6¾c.; Southern sliced, new, fair, 4½@5c.; choice do. 5¾@6c.; fancy, nominal; do., new qrs., in bags, 3½@4c.; do. repacked, 4½@5c.; Western quarters 4¾@5c. Blackberries at 8¼@8¾c. Peeled peaches, new, at 18@19c.; unpeeled peaches, halves, 9@10c.; do. quarters, 8¼@9c. Raspberries, 28@29c. Cherries, 17½c.

Exports past week 3,260 pkgs. apples; since Jun. 1st, 20,316 do., same time last year, 10,729 do.

EGGS.—The market shows some winter firmness, but not much real cold weather activity. Receipts are moderate, but there is considerable stored stock, the latter not bringing full quotations. A good many of recent arrivals show long holding, and only strictly fresh Western, loss off, will bring 29c. State and N. J. eggs nominal. Limed eggs quiet; quality not attractive. We quote:

Near points, 33@ 34c.; State and Penn., 28@30c.; Western, prime, 28½@29c.; do. Canadian, 28@28½c. State limed, 21@22c.; Western, do., 18@21c.

ESSENTIAL OILS.—The following are the current rates:

Peppermint, $2.50 ₱ lb. in tin, $3.25@3 50 in glass—tone firm. Sassafras scarce and firm at 50c. ₱ lb. Wintergreen, large supply, weak at $2.50. Spearmint, nominally $2.50 ₱ lb.; no demand.

FLOUR.—There has been a brisk business throughout the week. Exporters have been buying liberally and low grades are higher. Superfine, Minnesota extras, shipping extras and winter wheat grades have been taken in large lots at advanced prices.

The latest sales are $3.10@3.15 for poor to very choice superfine State; $3.35@3.65 for very common to fair extra do.; $3.70@3.75 for good extra do $3.80@3.90 for fancy do., and $3.95@4 for fancy to very choice extra; $3.10@3.45 for superfine Michigan Indiana, Iowa, &c.; $3.05@3.65 for shipping extra do., the inside price for inferior, and $3.70@3.75 for choice to very fancy extra do.; common to choice white wheat extras, $3.80@4.00; fancy do. $4.05@4.08; winter wheat, good to choice family, $6.25@6.25; round-hoop Ohio, $5.55@5.85, and trade brands of do. at $5.70@7; St. Louis, $5.60@5.75 for common to fair extra, and $6.80@8.25 for good to very choice; Minnesota "straight" at $6.65@7.50, and patent at $7.50@9.00; unsound stock at from $4.00@5.75; city mill extra for West Indies at $5.50@6.00; do. English brands, $5.60@—; do. trade and family, $7.00@8.50; No. 2 at $4.10@4.75.

FRESH FRUITS.—Exports past week, 22,072 bbls. there has been a lively trade in apples for export, also a good movement for local use. The weather has turned very cold and business will be apt to fall off. The market is a shade easier, best red fruit quoted at $1.75. Lady apples are abundant and unusually low. Cranberries have a steady sale and prices are favoring sellers, especially for prime N. J. bbls. Quotations for Florida oranges by the pkge are indefinite owing to the irregular size of boxes. They are dull at 2.25@2.50 ₱ 100. Catawba grapes are firm at 10@12c. when in good order. California Pears in good holding condition 3@3.50 ₱ box. A few California quinces still quoted at $3 ₱ box. Chestnuts not wanted. Hickory nuts in fair demand. Virginia peanuts are in large supply for the time when the trade in nuts has to be shared up. Prime only are selling.

Apples, State, ₱ bbl., prime red, $1.65@1.75; winter, $1.12@1.37; mixed, $1.12@1.35; good to fair, 90c@$1. Lady apples $5@7. Cranberries, crates, $2.50@3.00; Eastern, good to prime, $8@10; N. J. $8@9, for good to prime. Grapes—Catawba, ₱ lb., 10@12c. Peanuts—Va., fancy, $1.20@1.25; other, 70c.@$1. Hickory nuts, coarse, 50@75c.; shellbarks, $2@2.25.

FURS AND SKINS.—There is hardly a market here for raw furs and it is unlikely that wholesale prices will be adjusted until after the London sales. Lower prices are looked for abroad as the stock is heavy including numerous lots carried over.

GRAIN.—There has been a satisfactory market for wheat, with exporters buying more freely and prices higher; but at the close a dull feeling prevails on easier advices from Liverpool. Corn has been in moderate demand, but held firmly. Oats are favoring the seller. Latest sales of wheat include amber Missouri, in store, at $1.40; extra choice amber Michigan at $1.50; white Western at $1.45; ungraded spring, $1@1.32½. For No. 2 Milwaukee spring, $1.34@1.35 quoted, and No. 2 Chicago spring nominally $1.31@1.32. Buckwheat at 85@85c., and rye at 81@85c. for Western. No. 2 Canada barley, $1.06. Corn at 54@54½c. for new New York "no grade;" 56@56½c. for new steamer mixed; 58½c. for old New York "no grade;" 59c. for old New York No. 1; 58½@59c. for old Western mixed; 60c. for Kansas mixed, and 59@59½c. for New York mixed. Oats at 34c. to 49c. for mixed Western and State, and 38c. to 50c. for white do., including New York No. 2 at 38@38½c.; New York No. 2 white at 42@43c.; New York No. 1 at 47½@48½c.; New York No. 1 white at 48½@49c.; extra white, 48½@50c.; mixed Western, 34c. to 40c.; white Western, 38c. to 47½c.; mixed State, 40c. to 49c.; white State, 43c. to 50c.

HAY AND STRAW.—With the close approach to the close of river navigation receivers are more confident respecting prices; demand is fair.

Exports past week, 300 bales., since Jan. 1st, 39,531 do.: same time last year, 40,266 do.

Bale hay 80c. for shipping; 70@90c. for retail qualities; clover, 55@65c.; salt, do., 50@60c. Straw quoted at 70@80c. for long rye; 50@60c. for short rye, and 45@55c. for oat.

HONEY.—Quiet since the sales for Thanksgiving. The coming holidays may give it another start. We quote:—W. clover in grass, 15@20c.; B. W., do. 10@14c.

HOPS.—There continues a dragging market. The advices from Germany are against shipments of consequence to that quarter at present, there seems to be a good deal of dissatisfaction there with the class of stock sent over; it is the impression among the trade here that in a good many cases not sufficient carefulness was exercised in buying, or picking out grades that would show well after the length of time in a sea voyage. English shippers are buying very sparingly at present. The demand on home trade account is moderate. With this limited trade prices are depressed.

New Yorks, good to choice, new	27 to 30
New Yorks, low to fair, new	20 to 25
Eastern, new	25 to 28
Wisconsin, new	18 to 25
Yearlings	10 to 15
Olds, all growths	4 to 8
California, new	30 to 33
Oregon	28 to 30

POULTRY AND GAME.—Dressed Poultry has had a poor week and the fact is somewhat alarming when it is known that stock is in good order and prices are unusually low. Easy rates are expected this winter but the annexed rates are not encouraging for producers. Even the present low rates are 1c. higher that good stock sold for at one time this past week. Game is in fair demand and cold weather will be apt to keep the market brisk if rates are kept popular.

We quote.—Canvas-back ducks $1.75; Red Head 65@75c.; Mallard 60@70c.; Teal 50@60c.; common 30@35c.

Quail, ₱ doz., prime, $1.50@1.75, Partridge, State, 75@85; Prairie Hens, 90c.@$1; Hares, 50@60c.; Rabbits, 30@40c. Venison, whole, 9@10c.; longsaddle, 12@14c.; short do., 15@16c. Drawn games, 50@80c.; Partridges, 40@45c.

Live poultry not wanted; nominal at:

New Jersey turkeys, 8@ 10c. ₱ lb.; Western, 8@9c. N. J. fowls and chicks, 9@10c.; Western, 8@9c.; roosters, 5@6c. Geese, N.J., ₱ pair, $1.50@2; Western, $1.25@1.50. Ducks, N. J., ₱ pair, 75@$1; Western, 50@65c. Live pigeons, ₱ pair, 25c.

Christmas stock, chiefly geese, should be in market two or three days before the holidays. We quote:

Turkeys, N. J., 12@14c.; State, 10@13c.; Western, 8@12c. Chickens, dry-picked, 12@14c. N. J. chicks, 10@13c.; State, 8@11c.; Western, 8@10c. Ducks, N. J., 10@11c.; State, 9@12c.; Western, 9@10c. Geese, 15@10c. for common; 10@13c. for good to best. Inferior poultry, 6@7c.

PROVISIONS.—Hog products generally have ruled higher and fairly active; mess pork quoted at $17 on spot, $16.75 for December, $16.80 for January, and $16.10 for February. Dressed hogs at 7¾@7¾c. Bacon at 8¾c. for long clear, 9¼c. for short clear, and 9¾c. for long and short clear. Lard at $10.40 for spot lots, $10.45 for December, $10.42½ for January, and $10.55 for February. Tallow at 8¼@8¾c. for prime. Stearine at 10¾c. for prime Western. Beef hams at $20. Beef, barreled, is quoted at $10.50@11.50 for plain mess, $12@12.50 for extra mess, $13.50@14 for packet. Tierced quoted nominally at $20@21 for new prime mess and $22@21 for new India mess. City extra India mess at $27.

SEED.—Grass are very quiet and prices unsettled; clover quoted 15¾c.; timothy, $1.90@1.95; rough flax at $1.05.

TOBACCO.—Export purchases have been large, and prices not varied.

Ohio assorted lots	5 @ 7
Wisconsin assorted lots	3 @ 5

VEGETABLES.—Exports of potatoes past week, 2,660 bbls.; of onions, 164 do. Potatoes are in good demand but the consumption demand does not warrant the frequent advances that have been latterly made in prices. Times are rather too blue for wholesalers to undertake to manipulate the market. Onions are steady and a shade better. Cabbages higher. Squash firm.

Potatoes—Peach Blows ₱ bbl. $3.50@3.75. Early Rose, prime, $3.50@3.75; Peerless and Jackson white, $2.62@3 sweet, Del. $4.00@4; Va. $2.75@3. Cabbages, ₱ 100, $5@8. Murrow squash, ₱ bbl., $1@1.25. Hubbard Squash $1.50@1.75. New Russian turnips, ₱ bush., 75c.@—. Onions—Yellow, ₱ bbl., $1.75@2.00; white, $2.50@3; red, $1.50@1.75.

WOOL.—This has been a very dull week, but as not much trade is expected at this period when manufacturers are changing their cards for spring work, and adjusting their accounts for the year, prices have not been affected. The fall clip of Texas is coming in freely, but other descriptions are in moderate stock.

ROCHESTER, Dec. 9.—Flour market strong; spring, $7.00; amber winter, $7.25; white winter, $7.50; double extra, $8.00. Rye flour quiet at $5.00. Wheat steady; Milwaukee club, $1.30@1.40; amber winter, $1.25@1.35; white winter, $1.35@1.38. Oats, nominal at 38@40c. Corn quiet at 50@52c. Corn meal, $1.25@1.30. Butter, 25@26c. Cheese, 13@14c. Eggs, 25@26c. Lard, 10@10½c. Apples, bu., 25@40c. Potatoes, bu., 75c.@$1. Beans, ₱ bu., 1.20@1.70. Mess pork, $16.50. Wool, 25@36c. Hay, $10@12. Straw, $6@8. Timothy seed, $2.75@3.50; clover, $9.25@10. Mill feed firm at $14 for shorts, $16 for shipstuffs, and $20 for middlings. Railroad Freights—Flour to Boston, 35c. ₱ bbl.; to New York, 25c.; to Albany, 20c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Dec. 9, 1876.

THE cheese sold this week has been mostly of the November make, though a few factories having late Octobers made sale of these and their Novembers in one lot. The delivery of farm dairies was very light and was composed for the most part of late made. We quote sales at 11½@12½c., with only a few lots reaching the latter figure.

The offerings from factories this week have been comparatively light with sales of about 2,000 boxes. The range of prices has been from 12½ to 13½c. for Novembers and a few late Octobers mixed in. For good early Octobers 14c. was offered, but we have few or no sales to report. September cheese is now very scarce at this market, and we have heard of no offerings during the week.

Butter is coming forward quite freely, and prices this week have been a shade lower. Good to fair lots from farm dairies, late made, brought from 25 to 28c., and a few extra fine and creamery are reported at 29@30c. Grass butter is beginning to be scarce, and the butter offered this week has been made since the herds have been feeding on hay.

The weather is cold, but up to this date there has been only a slight fall of snow, and not of sufficient depth for sleighing.

The factories have commenced closing their operations for the season, though the larger establishments will continue to run a few weeks longer.

Our weekly dairy correspondence from abroad has failed to reach us this week, but we hear indirectly that fine cheese is advancing in price in the London market.

LIVE STOCK MARKETS.

NEW YORK, Dec. 9, 1876.

RECEIPTS OF LIVE STOCK.

	Beeves.	Cows.	Calves.	Sheep & Lambs.	Hogs.

" last week	9,636	42	1,622	20,294	35,515

BEEVES.—Monday last, on a heavy run of coarse quality cattle, with a choice quality top, trade was very slow and the markets closed weak, with several carloads unsold; prices were 7@11¼c. ₱ lb.; weights, 5@11 cwt. Wednesday, trade dull at 7@11c. ₱ lb.; weights, 4¾@8¾ cwt. Thursday, on a moderate run, trade slow at 7@10¼c. weights, 4¾@8 cwt. Friday, the markets closed weak at 7@11c.; weights, 4@10 cwt. Spanish herds, direct from the Plains, 7@8c.; Colorado do., 7½@8¼c. ₱ lb.; native, 7½@10c.; grade, 10¼@11¼c. Dry cows, 3c. Oxen at 7@9c. Mixed herds, 8@9c. ₱ lb. Bulls, live weight, $2.75@3.25 ₱ cwt. The quality of these herds was, in the aggregate, very coarse and lean. Fifteen head only obtained 11¼c. ₱ lb. to dress 62 lbs. net, all other sales on 55@57 lbs. net.

MILCH COWS.—Trade still dull on a heavy run, the chief part of which has been held on sale. Sixteen cows sold at $38@65 ₱ head; 21 do., $50@72.50 ₱ head—calves always included.

VEALS AND CALVES.—On an over supply of coarse quality calves, grass-fed, sales have been slow at 5@6¼c. ₱ lb.; also at $6.25@13.75 ₱ head. Smooth quality veals scarce; sales 9@10¼c. Country dressed calves sold at 6@7½c. Country dressed veals, 11@13c.

SHEEP AND LAMBS.—The quality of the flocks to hand has been from coarse to choice, still on a moderate run, sales have been slow and the markets weak. Monday, sheep sold at 4¾@6¾c. ₱ lb.; lambs, 6¾@7¼c. Wednesday, sheep, 4¾@6¾c.; lambs, 6@7c. Thursday, sheep, 5¼@6¾c.; lambs, 6@7c. Friday, the markets closed dull; sheep, 4½@6c.; lambs, 6@7½c. Jersey sheep, 5½@6¾c.; State, 4¾@7c.; Canada, 5@7c.; Illinois, 5¼@6¾c.; Ohio, 4½@6¾c.; Kentucky, 5¼@5¾c.; Pennsylvania, 5¾c. Jersey lambs, 8c.; State, 6½@7¼c.; Canada, 6¾@7c. Mixed flocks, 5¾@7c.

HOGS.—Trade fallen off in live hogs. Two carloads of Ohio hogs, average live weight 185 lbs ₱ head, 6¼c. ₱ lb. Trade in city dressed slow on advanced rates, being 9¾@9¾c. ₱ lb. for hogs; choice quality light market pigs, generally quoted from Jersey, 8@9c.

HORSE MARKET.—City trade firm but not active. 10 head poor quality, light harness horses sold at $40@85 ₱ head; 18 do., $57.50@92.50; 13 do. $90@115; 81 ordinary quality, $125@200 ₱ head; 17 coarse quality heavy draft horses, $85@107; 18 roadsters, with fair trotting action, not warranted sound, $225@335 ₱ head; 4 trotters, $300@750 ₱ head; 2 saddle horses, poor quality, $150@175 ₱ head; 1 pair fair quality carriage horses, $200; 3 pairs stylish do., $1,225@1,350 ₱ pair; 7 pairs family do., $300@500 ₱ pair; 2 pairs choice quality heavy draft horses, $650 ₱ pair. Sixteen horses arrived ₱ Erie Railway via, Oak Cliff Station.

ANSWERS TO CORRESPONDENTS.

A. A. W.—There is no difference between a plum and a prune, and German and Italian prunes are only varieties of plums cultivated in those countries. But there are certain sorts more extensively cultivated for drying than others, hence they become known in market under different names—besides, some sorts are much better for this purpose than others. The name of "Beatrice," when anglicised, is pronounced Be'a-tris; the accent is on the first syllable, the "a" having rather a short sound, like "a" in "fat"—the third syllable pronounced as though terminating with an "s," as written.

E. Pierce, Jackson, Mich.—The following answer explains the question:—The ground about that which you have selected for the site of your house, cannot be thoroughly drained without going to the expense of a regular system of drainage. We would ourselves prefer to elevate the site of the house several feet and then, by filling in to slope the ground gradually to the road in front and to the natural drainage in the rear. Thus ditching and pipes will be unnecessary and the liability of the latter to become clogged will be avoided.

Much as has been written as to the unhealthfulness of pools of water standing about or near the dwelling, yet we find in the country that little or no attention is paid thereto. Stagnant and "vicious puddles" may be seen in every other cow-yard within a stone-throw, while slops from the kitchen often conducted through wooden troughs, are led scarcely ten feet from the house where a seething pool may generally be found to generate poisonous gases that frequently induce malignant fevers. The gas which is formed in such pools may be collected by the following simple experiment and its poisonous character ascertained:

Fill a jar with water and invert it in the pool. Stir the earth beneath the jar with a stick; bubbles will be seen to ascend through to the top of the jar, displacing the water and filling the space with the gas contained in the bubbles. This gas will be found to be light carburetted hydrogen, which is at once destructive to animal life. It is the same that accumulates in coal mines known as fire-damp, the frightful accidents from which, that shock the world from time to time, are too well known to all.

Cambridge.—Belladonna is used in allopathic as well as in homœopathic practice. 2. The plant is *Atropa belladonna*, Deadly Nightshade, and belongs to the same family as the Potato, Tomato, Pepper, Ground-Cherry, etc. It bears a bell-shaped flower of a palish, sickly purple color, and the fruit is as large as a cherry—at first green, becoming glossy black and filled with purple juice. 3. The leaves are used in medicine, either in substance, infusion or extract. Taken in allopathic doses, its action is that of a powerful narcotic; in infinitesimal doses it is used in fevers which are attended with inflammatory action of the brain. 4. It is not related to *Amaryllis belladonna*. Its English signification is "beautiful lady."

C. A. B., Brunswick, asks many questions regarding Mr. CHARLES DARWIN'S work, "Origin of Species, etc.," which to answer explicitly, would fill a column. Many of his questions, however, resolve themselves into the following: "What is the work intended to show?" This we may answer. Mr. DARWIN holds that all organic life varies and that this variation gives rise to varieties; that these varieties by natural selection become species and genera; that natural selection is the result of a "struggle for existence," and that a universal struggle for existence is the natural consequence of the rapid increase of all organic life.

A. A. Brown, Warren, Ohio.—Young trees, if washed once or twice every year with almost any of the mixtures recommended for this purpose, will not need to be scraped. The rough bark of neglected old trees affords shelter to insects, many of whom live upon the sap of the green bark (*mesophloeum* as it is termed in botany), while others penetrate the inner bark (*endophloeum* or liber) impairing the vigor of the tree to a greater or less extent. But it would require a great deal of time and trouble to scrape the bark from the old trees of your orchard, and whether they would be benefited in a degree to compensate you for so much pains can best be determined by those who have seen the trees and know something of their value.

C. E., Westfield, N. J.—We have used carbolic acid sufficiently diluted with alcohol upon the part of the tail which the horse rubs. It is well first to wash the tail thoroughly with castile soap. In nine cases out of ten, the inclination in the horse to rub the tail proceeds from the fact that the sheath needs attention.

Note.—We have seeds (as requested) for W. H. Prentice. We are awaiting address.

M. B. Prince.—I mailed to Floral Editor a flower a few days ago for name.

ANS.—*Euonymus Americanus var. obovatus.* Spindle Tree—Strawberry bush.

Implements and Machinery.

Centennial Year of American Independence.

SWITZERLAND to AMERICA, Greeting:

We will call and see you next July and assist at your CENTENNIAL CELEBRATION. By the same opportunity bring you samples of the Celebrated Watches, manufactured by our country-men, the MESSRS. BOREL & COURVOISIER of Neuchatel, for INSPECTION and EXHIBITION. These Watches are favorably known throughout the U. S., having been sold by our local agents in almost every City, Town and Village the past ten years. Their reputation for accurate performance is universally acknowledged. They are manufactured in Gold and Silver Cases, Stem and Key Winders. These Watches have superior quality of Nickel Movements, Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronized for R. R. use, fine Ruby Jeweled, set in Cluton, and warranted to perform with the regularity and accuracy of a chronometer. Ask your Watchmaker to see them before purchasing those of other makers, as we have been authorized to sell them at a reduction from former prices.

Traveler's Guide.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTHWESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to

MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

MOORE'S RURAL NEW-YORKER is one of the readable, useful, family papers, equally in demand by the lady in her conservatory, the matron with her household, the farmer in his field, the stock raiser among his animals, and the young folks around the evening lamp.—*Lakes of Life.*

PERSONAL ITEMS.

SANKEY's getting up a new hymn book.

THE late E. J. Peck of Indianapolis has left by will $118,000 to Wabash College.

A WOMAN was the founder of the first savings bank, and her name was Priscilla Wakefield.

PROF. SWING says that a hat won on a bet "comes down over the eyes of the winner's soul."

JEFFERSON DAVIS has arrived at his home in New Orleans much improved by his trip to Europe.

LIEUT. JOHN P. JEFFERSON of Company A, Fifth Artillery, U. S. A., is a son of Joe Jefferson, the comedian.

THE former wife of a bank cashier in San Francisco has married a negro, thus horrifying her fashionable friends of other days.

BISHOP GILBERT HAVEN has taken a ship-load of colored people to Africa, where they are to find perennial happiness and education.

MR. HALLAM TENNYSON, a son of the Laureate, is a writer of some promise. He has an article in the current number of The Contemporary Review.

ROORBACKS are of ancient mythological origin. It is related that after Charon had rowed Eurydice across the Styx, she at once ordered him to ro'er-back.

BY her own efforts Miss Susan B. Anthony has paid off the debt of $10,000 incurred by the failure of the "Revolution," a paper advocating "woman's rights."

KING JOHN of Abyssinia has appointed Major Barlow, an English officer, to be Commander-in-Chief of all his forces. He has started for the seat of war in Africa.

SALVINI is wealthy, and now that he is married he plays for money no more. It is only charity, or good comradeship, that now brings him occasionally to the stage.

THE old Countess of Montijo has gained her case against the Paris journal, which asserted that her daughter, the ex-Empress Eugenie, was an illegitimate offspring.

THOUGH the King of Denmark has been on the throne thirteen years he has never been crowned, the troubles between Denmark and Germany in 1863 rendering the costly ceremony inauspicious.

THE Lancet announces the recurrence of Prince Leopold's malady—a swelling of the knee. He is the youngest son of Queen Victoria, and his health has long been precarious. The symptoms are said to be grave.

MR. CARLYLE said to Prof. Huxley not long ago: "You Darwinians are spending your lives in trying to prove that men are descended from apes;—and it needs more than our civilization to prevent them from being ogres."

MRS. WILCOX, the daughter of Andrew Jackson Donelson, the nephew and adopted son of Gen. Jackson, is a translator in the Dead-Letter Office. She has been translating the postal treaty between this country and Italy.

SAID a woman speaker in a New Haven suffrage meeting:—"Woman is in every respect the equal of man. Her reputation for heroic bravery"—at that point a mouse ran into sight, and the orator jumped on the table and screamed.

THE son of an Earl recently applied for his discharge at the Woolwich (England) Police Court. He had enlisted in the Royal Artillery because he had only five hundred pounds pocket-money annually, but after twenty-four hours in a barrack repented. He was discharged.

GENERAL BECKER, who has a large farm on the St. Paul and Pacific Railroad, proposes to devote a considerable tract to the cultivation of walnut timber. Experiment has demonstrated that the soil and climate are adapted to the growth of this valuable wood.

MR. BRET HARTE'S "Two Men of Sandy Bar," a pretty little gray volume, lies under lock and key with 999 companions in Mr. Osgood's storeroom. The trouble is about the copyright; Mr. Osgood and Mr. Harte want to publish the thousand little volumes, and Mr. Stuart Robson doesn't.

THE North American Review has been sold to a young New Yorker named Rice, who has gone to Boston to live. He will be assisted in its editorship by Rev. J. H. Ward of Marblehead, Massachusetts, and it is understood that the political articles will be prepared by Prof. Seelye of Amherst.

MR. FROUDE is out in favor of more practical methods of education. "Human life," he says, "is action and not speculation; culture would be best arrived at if it was of a more special kind, and young men came to the university to be taught those branches which hereafter would be of use to them."

SOME Ellenville gentlemen during the past season have made purchases of large tracts of land on the Shawangunk Mountain, most available for the erection of boarding-houses, and they have during the past season been opening roads and doing other preliminary work preparatory to very important improvements.

THE match-makers are busy this winter. A new wrinkle just out, is the wristlet parties. The ladies furnish the wristlets, and each pair is numbered. One of each pair is put into a box and sold to a gentleman, the corresponding number being worn by a lady. After the purchase the gentleman seeks his mate by number, and to the lady he is engaged—at least for that evening. There is fun in it.

ATHENÆUM:—"It is only too common to divide the inhabitants of European Turkey broadly into Turks and Christians. We seem, however, to recognize three distinct classes of Turks—the agricultural Turk, who possesses all sorts of primitive virtues in perfection; the official Turk, who plunders, and the bashi-bazouk, who murders."

THE attachments or "sister hooks" by which the heavy "foot bridge cable" was fastened to the "carrier," during the transit across from the Brooklyn anchorage to the New York anchorage of the East River Bridge, have been removed, and the heavy mass of metal now swings free between the towers, the ends being perfectly secured at each of the anchorages.

COL. HIGGINSON gives it as his opinion that the women's exhibition at Philadelphia was exceedingly interesting, and in its proper place, and adds:—"If it could be proved—which it certainly cannot—that each separate piece of work there shown was surpassed by some similar piece of work done by men elsewhere on the grounds, the value of the Woman's Pavilion would remain the same."

MR. HAWKINS, the distinguished English lawyer and Queen's counsel, who, it will be remembered, conducted the prosecution against the Tichborne claimant, has just been made a Judge of the Common Pleas branch of the High Court of Justice. His services, however, will be transferred to the Exchequer division by the Lord Chancellor, acting under the power given him by the recent Judicature act.

A PRETTY school marm of Wisconsin County, to prevent scholars from being tardy, promised to kiss the first scholar who made his appearance at the school-house. All went well for a few days, and the nineteen-year-old boys, anxious to participate in this fun, actually got to roosting on the fence all night, in order to be at school the first in the morning. This became monotonous, and the teacher gave the idea up.

"THE great caricaturists of the latter days of the Georges all came to gloomy ends. They, who knew so well how to make all the rest of the world laugh, were themselves the victims of distress and trouble. Rowlandson died in poverty; Hogarth died of a broken heart, caused by attacks upon him by Wilkes and Churchill; and Gillray, the most genial of humorists, committed suicide in a fit of melancholy."

GOV. KELLOGG of Louisiana is about 50 years old. He is of medium hight, is slender and erect, and wears a closely-buttoned coat. His head is small, the forehead evenly rounded and sloping backward with too great rapidity. His hair is gray, and worn as if much time had been employed on it with a brush in front of a mirror. His mustache is gray, heavy, and with pointed waxed ends. The face is small and apparently good natured; the eyes a light brown, and, while pleasant, are full of insincerity. In fact, the expression of insincerity seems to prevail everywhere—in eye, smile, and the studied gestures of his white but not shapely hands. His voice is a pleasant one. So writes an unfriendly correspondent.

"ANXIOUS" sends to the New York Tribune the following matrimonial problem, which, she says, is based upon "actual facts":—"In 1854 Mr. A married Miss B. He went abroad, and was compelled to marry Miss C in order to save his life. On his return to America he ascertained that his first wife (B) was dead. He then married Miss D. He went abroad and did not return until 1866. He called on his third wife (D), and was shown to the door. She (D) had heard about B and C, and threatened him (A) with arrest. Being nominally a widow and having frightened A into silence, she married Mr. E. Mr. A then married F, who had the rare discretion to die promptly. Now if D was not A's wife from the fact that C was alive when A married D, is E to be regarded as D's husband? Is D A's wife or E's?" Try Luke xx., 34, and consult editor of The Deseret News, Salt Lake.

MR. J. W. FORNEY, Jr., says of Miss Dickinson as an actress:—"She flirts with King Henry like a timid country lass schooled to smirk and courtesy, but without the refinement and the former associations to mind her lesson. She talks, too, of love, as she might of the weather, and if she attempts to typify the passion, it is as if she were attempting to burlesque it. And yet as the play goes on one sees why Anna Dickinson thought she might be an actress. Her scenes with the Cardinal, with Percy, with Cromwell, often give hope of real dramatic power; the audience is hushed in interest, but a moment afterward she drops again, and drops so far that the chill of disappointment goes over all. When Miss Dickinson is required to act, as in the last scene with the block in her palace prison, the regret that she has dared what she has deepens. Every movement is forced; there is nothing natural, nothing which does not say, 'I am trying so hard to do this.' Her play is remarkably well constructed, but only fairly and very unevenly written. There are gems among the speeches fit for any work, but there is very much that is commonplace. In the hands of a true dramatic artist, 'The Crown of Thorns' will live. But Anna Dickinson is a woman of determination and pluck. She has not only the will to decide, but the courage to carry through, if it be in any way possible, what she tries. She will fight her fight for pre-eminence on the stage honestly and fiercely, and will not give up until her own mind is satisfied it cannot be. Her whole record proves that, and it may be she will prove us all false prophets."

New Publications.

POTTER'S AMERICAN MONTHLY.

50,000 Subscribers for 1877.

THE WONDER of Nature is the elegant and recherche "PETRIFIED PERFUMED SHELLS," the most delightful and lasting perfume known. The shells are imported from Ceylon, are a sure preventative of moths, and the most *recherche* perfume ever discovered; used by all the *elite* of Paris and London, as well as by the aristocracy of America. These shells are *perfect beauties*, last *forever*, and impart a charming perfume to drawers, clothing, and all they come in contact with. Each shell is in a beautiful case, and can be mailed anywhere. Agents—ladies and gents—wanted, to *clear* $7 a day selling these wonderful shells. Sample Shell sent free, with terms, etc., for only 25 cents. Send all orders only to HUNTER & CO., Hinsdale, N. H.

PROSPECTUS FOR 1877.

LIPPINCOTT'S MAGAZINE,

AN ILLUSTRATED MONTHLY OF

Popular Literature, Science & Art.

ANNOUNCEMENT FOR 1877.

The number for January begins the nineteenth volume of this Magazine, and while its past record will, it is hoped, be deemed a sufficient guarantee of future excellence, no efforts will be spared to diversify its attractions and to provide an increased supply of

POPULAR READING IN THE BEST AND MOST EMPHATIC SENSE.

The great object and constant aim of the conductors will be to furnish the public with **Literary Entertainment of a Refined and Varied Character**, as well as to present in a graphic and striking manner **the most recent information and soundest views on subjects of General Interest**; in a word, to render **Lippincott's Magazine** strikingly distinctive in

THOSE FEATURES THAT ARE MOST ATTRACTIVE IN MAGAZINE LITERATURE.

The contributions now on hand, or specially engaged, embrace a highly attractive list of

Tales, Short Stories, Descriptive Sketches, Narratives, Papers on Science and Art, Poems, Popular Essays, Literary Criticisms, Etc., Etc.,

BY TALENTED AND WELL-KNOWN WRITERS.

A large proportion of the articles, especially those descriptive of travel, will be

PROFUSELY AND BEAUTIFULLY ILLUSTRATED.

The pictorial embellishments of the Magazine constitute one of its many attractive features.

In addition to the GENERAL ATTRACTIONS of LIPPINCOTT'S MAGAZINE, the Publishers would invite attention to the following

SPECIAL FEATURES FOR 1877.

1. A new serial story,

"THE MARQUIS OF LOSSIE,"

by GEORGE MACDONALD, author of "Malcolm," "Alec Forbes," "Robert Falconer," etc.

To those of our readers who are familiar with "Malcolm," this new story from the pen of this distinguished writer will need no recommendation, and his reputation is a guarantee to others of a deeply interesting and powerful story. It began in the November number, which issue, with the December part, will be furnished gratis to all new subscribers for 1877.

2. A profusely illustrated series of sketches of

SWEDISH SCENERY AND LIFE,

by Prof. WILLARD FISKE of Cornell University, who is thoroughly familiar with Sweden and its People from personal observation.

3. A series of popular papers on

ART AND ART MATTERS,

by EDWARD STRAHAN (Earl Shinn), author of "The New Hyperion," etc.

4. Illustrated Sketches of Travel, entitled

PICTURES FROM SPAIN,

by EDWARD KING, author of "The Great South," etc.

5. Mrs. LUCY H. HOOPER'S Interesting and Piquant

PAPERS AND LETTERS FROM PARIS

will be continued through the year.

6. **THE BEAUTIES OF THE RHINE**

will be described in a richly illustrated series of papers.

7. During the year will appear a number of handsomely illustrated short articles, descriptive of Life, Travel and Adventure in the United States, England, South America, Japan, Mongolia and other countries.

FOR SALE BY ALL BOOK AND NEWS DEALERS.

Price 35 Cents.

TERMS.—Yearly Subscription, $4; Two Copies, $7; Three Copies, $10; Five Copies, $16; Ten Copies, $30, with a copy gratis to the person procuring the club. Single number, 35 cents.

NOTICE.—The November and December Numbers, containing the earlier chapters of "The Marquis of Lossie," will be presented to all new annual subscribers for 1877.

SPECIMEN NUMBER mailed, postage paid, to any address, on receipt of 20 cents.

TO AGENTS A LIBERAL COMMISSION WILL BE ALLOWED. Address

J. B. LIPPINCOTT & CO., Publishers,
715 & 717 Market St., Philadelphia.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper* and in Premiums to Agents.

New Publications.

1850 Twenty-Eighth Year 1877

OF THE

RURAL NEW-YORKER.

THE GREAT ILLUSTRATED AGRICULTURAL AND FAMILY WEEKLY has

REDUCED ITS SUBSCRIPTION PRICE

For 1877.

It is the Standard Authority on AGRICULTURE, HORTICULTURE and DOMESTIC AFFAIRS, and is replete with news and improvements of value to

The Farmer,	The Dairyman,
The Horticulturist,	The Housewife,
The Stock Grower,	The Girls and Boys.

In addition to these Practical Subjects and its Market Reports, several pages are devoted to Household Recipes, pleasant Stories, Reading for the Young, Sabbath Reading, Fashions, News, and all topics of interest to the family. Thus it comprises

TWO PAPERS IN ONE

and cuts like a two-edged sword into the affections of the ladies and children, as well as the members of the family who seek instruction in their daily avocations.

A. S. FULLER, the celebrated Horticulturist, is Editor-in-Chief, assisted by E. S. CARMAN, the well-known Floriculturist and writer on Rural Topics, and X. A. WILLARD, the great practical Dairyman, who call to their aid as special contributors, S. B. PARSONS, Floriculturist and collector of rare exotics; WILLIAM ROBINSON, Editor London Garden; Col. F. G. SKINNER, Editor Turf, Field and Farm; Prof. CHAS. V. RILEY, Missouri State Entomologist; HERMAN STRECKER, Lepidopterist; WM. J. FOWLER, writer on Farm Economy; THOS. MEEHAN, Editor Gardeners' Monthly; JAMES VICK, the great Rochester Florist; GEO. SUCH, Floriculturist; JOSIAH HOOPES, noted Botanist; S. B. PECK, M. D., writer on Hygiene; HENRY HALES, the practical Poultry Breeder; L. A. ROBERTS, writer on Historical Subjects, and a host of other gentlemen equally celebrated and learned, as well as an efficient corps of Special Reporters, to keep the readers informed upon all subjects of interest to the Rural population.

From the pens of such celebrated writers the Practical and Scientific Departments receive life, while the Literary and Family Departments are under the careful supervision of a corps of experienced Editors and Contributors, who successfully devote their energies to making this Journal the superior of any in the land.

It contains each week sixteen pages of instructive and interesting reading, embellished with fine engravings upon all interesting subjects.

The Reduced Price is only $2.50 a year, postage prepaid by Publishers, and in clubs of ten or more only $2 a year.

The RURAL is so well known that little difficulty is experienced in forming a club in any locality, and every one is invited to form a club—thus securing their paper cheaper and benefiting their neighbors.

Every one can have a specimen copy FREE, and, if they desire to form a club, a list of Premiums to Club Agents, by addressing

RURAL PUBLISHING CO.,
78 Duane St., New York.

Adapted to All Sections of the Country.

THE NEW JERSEY AGRICULTURIST

A plain, practical, 8-page monthly, devoted to the Farming, Gardening and Household Interests. Tells when and how to plant. Hints each month for the Farm, Garden, Lawn, Greenhouse, Window and Indoor Gardening, Etc. Just the paper to suit the times, and only 50 cts. per year. Sample copies free. Liberal pay and a Cash Premium to Agents.
N. J. AGRICULTURIST,
20 Hiram St., New Brunswick, N. J.

Stock and Poultry.

IMPROVED JERSEY STOCK.

A thorough-bred Jersey Cow for sale, from imported dam; is registered in the Jersey Herd Book. Also two Heifer Calves. Address
H. HALES, Ridgewood, N. J.

THOROUGHBRED POULTRY

Brahmas--Leghorns--Hamburghs.

MY FOWLS are the most fashionable blood in the country, being exclusively from prize-winning stock.

A THOROUGH-BRED Cock will repay his cost ten times in bringing up the average of the whole yard by the infusion of "new blood."

BRAHMAS for size, and as winter layers are prized highly.

LEGHORNS for early development, and as non-sitters are unsurpassed.

HAMBURGHS as layers, and for beauty are unequaled.

Chicks sent C. O. D. SEND STAMP for Circular.
T. W. WHITE,
Ridgewood, Bergen Co., N. J.

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

Wit and Humor.

MUSICAL ITEM FROM TEXAS.

THERE is quite a number of very respectable men in this town, who have no ear whatever for music. In illustration whereof, we submit the following:

Yesterday afternoon one of the most influential citizens of Ward No. 5 approached a policeman on the Piazza, and began conversing with him after this style:

"Aint you the policeman who is on night duty in my ward?"

The policeman replied that he was.

"Well," continued the irate taxpayer, "what I want to know is why you let that drunken wretch howl and shriek and fling tin pans about half the night, so I can't get a wink of sleep?"

"Right opposite where you live, Colonel?"

"Yes. He begins at eight o'clock, and he goes on loud enough to wake even a policeman up."

The policeman smiled grimly and replied: "I did hear that row, Colonel, and I got a pair of handcuffs and some ropes and a dray, but when I got inside of the house I found it was only a young lady singing at a piano."

And then the two steered for a saloon, the policeman promising he would not say a word about the matter. This is a great climate for lungs.

SPARKS AND SPLINTERS.

GREAT gifts make beggars bold.

A GENUINE roar-back—An echo.

SAD spectacle—Broken eye-glass.

BOYS who run for Congress—the pages.

THE third river in Scotland is the Forth.

THE place for tar getting excursions—North Carolina.

WHY is a note of hand like a rosebud? Because it is matured by falling due.

A DOG fight is not a noble spectacle, although it is undoubtedly a display of cur-rage.

GENIUS is the capacity for making an ass of yourself at the unexpectedly right time.

IT is a curious fact that when the barometer of the minister's sermon says "Very dry," that of the people points to "Sudden change."

"WHAT did the Puritans come to this country for?" asked a Massachusetts teacher of his class. "To worship in their own way, and make other people do the same," was the reply.

Two rural constituents were talking of the new member of the Legislature from their district. One of them asked:

"Is he talented?"

"Well," said the other, "I should say he might set a house a fire by rubbing his nose against the door-post."

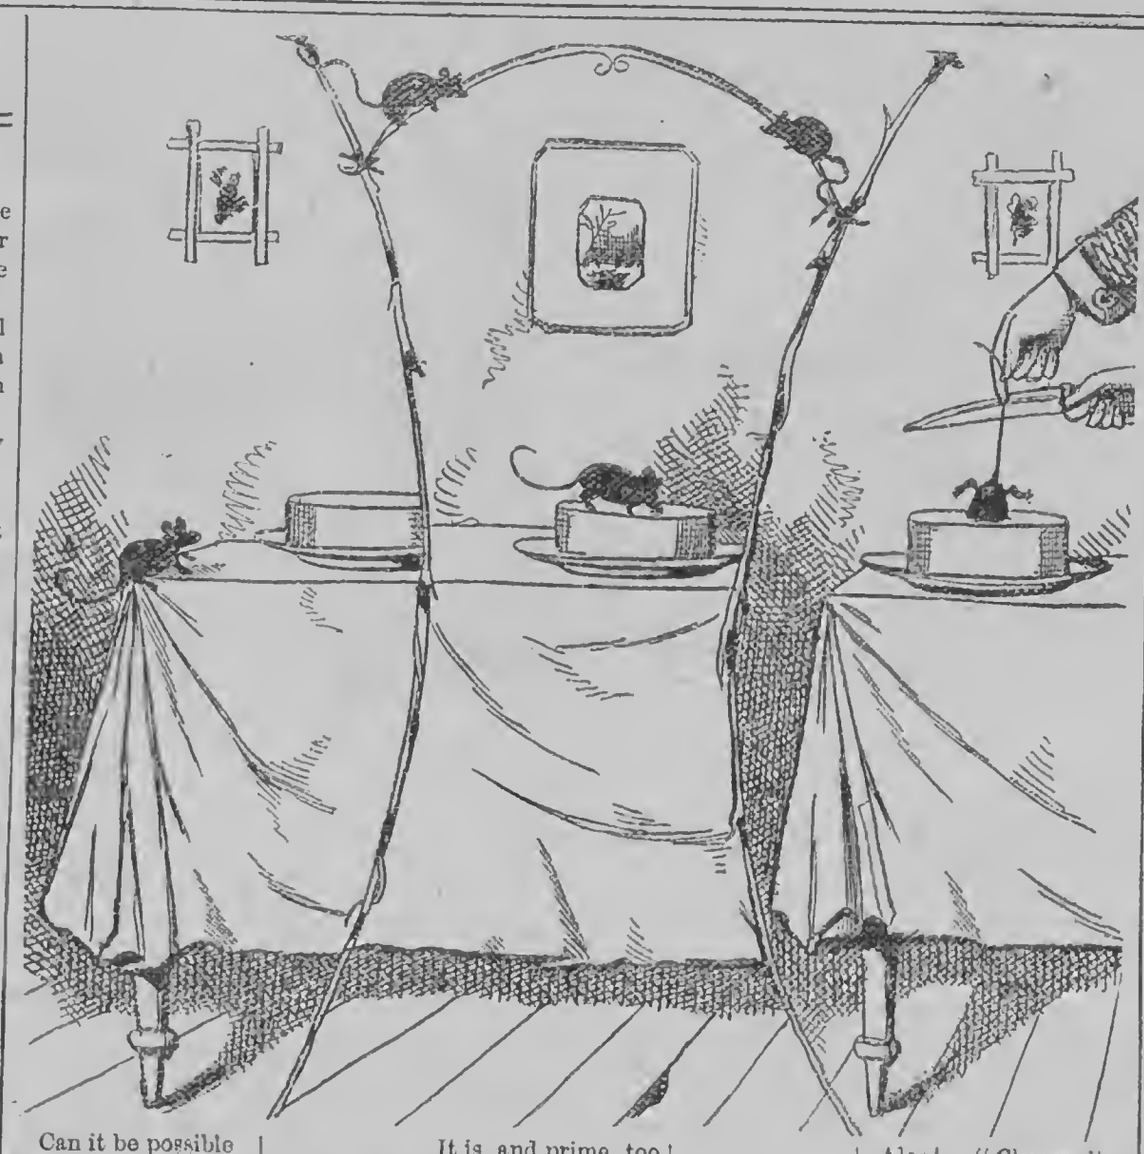
SOCIETY journals mention that bridal trips are becoming unfashionable. The wedding generally takes place about four o'clock P. M., and the bridegroom spends the balance of the afternoon figuring for a position at the dinner table as far removed as possible from the seat occupied by his mother-in-law.

NOBLESSE OBLIGE.—Host, to Eligible Youth: Trust we shall have the pleasure of seeing you at our ball on Thursday. You will meet a Colonel, two J. Ps., two poets, and a Member of Parliament. Guest—Thanks, so much; but it's impossible. I am invited to the Tudervilles', where I shall meet a General, six J. Ps., no Poets and a Lord!—[Funny Folks.

A MAN rushed into a Main street restaurant the other day in an awful hurry, and, flopping into a chair, called for "calf's head soup." "Calf said what, sir?" inquired the waiter. "Calf's head soup!" roared the impatient guest. Admonished by the wrathful tone, the waiter moved away, but paused to inquire, as a kind of appendix, "You didn't hear him say what kind of soup, sir?"

A WESLEYAN brother was engaged in preaching a collection sermon, and pleaded earnestly that the congregation would give him a good collection. At the conclusion the plates were produced, and the good man perceiving that copper, and not silver, was the prominent coin, said, with great solemnity, "I perceive, my brethren, that now, as in the days of Paul, *Alexander the coppersmith has done us much evil.*"

WAGGISH.—"My friends," said a returned missionary at one of the late anniversary meetings, "let us avoid sectarian bitterness. The inhabitants of Hindoostan, where I have been laboring for many years, have a proverb that 'though you bathe a dog's tail in oil and bind it in splints, yet you cannot get the crook out of it.' Now a man's sectarian bias is simply the crook in the dog's tail, which cannot be eradicated; and I hold that every one should be allowed to wag his own peculiarity in peace."



Can it be possible that this is a cheese? | It is, and prime, too! | Alas! stranger, "Cheese it, cheese it."

MOORE'S RURAL NEW-YORKER.

RURAL AND HOME AFFAIRS. ARTS, SCIENCE, LITERATURE, NEWS, MARKETS, ETC.

VOL. XXXIV. No. 26.
WHOLE No. 1404.

NEW YORK CITY, DEC. 23, 1876.

PRICE SIX CENTS
$2.50 PER YEAR.

[Entered according to Act of Congress, in the year 1876, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

A MERRY CHRISTMAS.

CHRISTMAS morning dawned bright and beautiful. It snowed during the night, but now the sun is shining brightly, making the icicles and snow-flakes glisten like diamonds. Jack Frost has been at work, too, tracing delicate pictures upon the window-panes. How many thousand children have been looking forward with eager and joyful anticipation to this morning which, of all the days in the year, is pre-eminently Children's Day!

Among this number are our little friends in the picture—hazel-eyed EDITH, golden-haired ALICE, and roguish little HARRY, who is "free year old to-day." They have talked of nothing but Christmas and SANTA CLAUS for weeks, and now the long-wished-for day has arrived.

These children live in an elegant house, the sight of which would seem almost like fairy-land to many a poor little beggar-child whom SANTA CLAUS, in all his wanderings, sometimes seems to forget.

EDITH was up and dressed bright and early, and then ran to see if her little brother and sister had their "peepers" open. When she opened the door they sprang out of their warm little beds, shouting, "Merry Christmas!" which was returned by the elder sister. Without waiting to be dressed, they ran, barefooted, into the nursery, where they had hung their stockings the night before, right beside the fireplace, "Where SANTA CLAUS will be sure to find them."

Now let us peep in before them and see what they will find in the plump little stockings. As EDITH is oldest, let us look into hers first. Here we find story-books and paper dolls, a set of furs to keep her dolly warm, and a pretty little fan. Underneath, on the floor, is a perfect little trunk, containing a complete wardrobe made in the latest style for dolls and also a nice carriage for "Lady Clara" to ride in.

What will ALICE find in hers? The first thing we see is a little woolly dog with a blue ribbon tied about his neck, who sticks out his head and looks "bow-wow" at the children, as they stand there at the door. There is a set of blocks with which she can build houses; a tiny little baby-doll and a picture-book, which EDITH will read to her; and on the floor is a little table, tablecloth on, set completely, and even napkins at each plate. ALICE will probably have some of her little friends to take tea with her to-night, if mamma is willing.

And now we come to little HARRY'S stocking. SANTA CLAUS has dealt bountifully with these children, for here we find a large jumping-jack and a tin horn, on which he will try to make music for the family. A large Noah's Ark, a whole regiment of tin soldiers, and a farm-yard full of chickens, ducks and turkeys, complete the contents of the stocking, which, by the way, was one of mamma's, as he thought his was too small. But on the floor is a present which will please him best of all—a beautiful sled, painted red, with the name "Comet" in gold letters. How delighted he will be to think that he can try it this morning! and he will probably not stop to eat much breakfast, so anxious will he be to go out before the snow melts. Besides all these presents, there are three large boxes of candies, nuts and raisins, as well as oranges and figs in abundance. After examining their gifts the children went back to be dressed and then to mamma's room, waking her by calling "Merry Christmas" in her ears.

You can imagine what a pleasant day these children passed with their many new playthings nor was their pleasure marred by petty quarrels or disputes, as is too often the case among children; but they went to bed that night tired and happy as they well could be.

But this is only one kind of a Christmas celebration. There are many different sorts of people in the world, and almost every one has a particular way of spending holidays; but giving and receiving gifts is a custom almost universally observed among those who are able. Some, of course, can afford to give only little tokens, while others spend hundreds of dollars in making costly gifts which, oftentimes, are not appreciated by the recipients so well as something more simple, but still useful or beautiful.

And yet there are many, many poor children who scarcely know what Christmas means; it being to them no different from any other day.

In England Christmas is, if possible, more generally observed than in this country, and one of the chief features of the celebration is the Christmas Pantomime, in which the children participate.

On Christmas Day poor children go about the streets, hoping to earn a few pennies by singing Christmas carols, composed expressly for the occasion.

Then, too, it is customary to give a party or ball on that evening, when the mistletoe bough figures conspicuously in the decorations.

From Germany we borrow our idea of the Christmas tree, which is a never-failing source of amusement to the children, and it is a beautiful sight to see a party of them viewing a heavily-laden tree, bright with myriads of little wax candles of various colors, whose lights are reflected in the glass balls with which the tree is ornamented. A little "Christ-child" in the topmost branches is a great addition.

Would it not be well for our little readers of the RURAL to look up some of their toys or books, of which they are tired, and send them to any poor children of whom they may hear? and by so doing they would aid others as well as themselves to have a Merry Christmas and a Happy New Year?

A MERRY CHRISTMAS.

Farm Economy.

FARMERS AND AGRICULTURAL PAPERS.

If in the cultivation of their lands, farmers hope to be successful, careful thought must necessarily guide their efforts according to well laid plans. Not a few among them are old enough to remember the time when muscle and brawn were man's chief glories, whereas now mind and thought take precedence, and in the great advance of the mechanical and other arts, these have been enlarged and enriched. Brass and iron in its multifarious forms, are the thews and sinews of the 19th century, but well trained thought must not only fashion these but direct their use.

In writing to the RURAL NEW-YORKER, it is my desire to stimulate farmers to a better cultivation, not of their lands alone, but also of their minds, as well as to strengthen in them a love of their occupation; for no man can find happiness in a labor he does not love, neither can he expect to prosper unless he has an affection for the pursuit in which he seeks prosperity.

In this age of rapid progress a serious question which should hold a prominent place in the minds of all farmers is, "How are we to keep pace with the swift advance in other arts and avocations?" In all ages and countries farmers have been the most conservative class; stick most tenaciously to old habits, ideas and usages, and are least disposed to welcome novel notions, practices, or inventions. In other occupations most of the improvements in the processes and implements have been made by those engaged in them, whereas in agriculture nearly all the mechanical and even practical improvements are the donations of other professions.

The mechanic, the manufacturer, the professor, the chemist and the scientist are all deeply impressed with the certainty that the processes of to-morrow will be ahead of those of to-day and yesterday, and make use of their present acquirements as foundations for further improvements, and acquisitions. Farmers alone seem disposed to believe that the world has seen its best days, and that the ruts their fathers and grandfathers have traveled in are good enough for them too. Yet until they get out of these worn ruts, become keenly alive to the progressive spirit of the age, and as eager as all around them, to improve their condition by improvements in the appliances and methods of their labor, they must necessarily lag behind their more earnest contemporaries, and fail to obtain the consideration and influence due, of right, to their multitude and to the importance of their station in the scheme of society. For to gain influence and success in any age it is essential to be imbued with its spirit, and this is emphatically a progressive and scientific epoch.

While the researches and improvements of each individual farmer are, as a rule, necessarily limited, and inconsiderable, yet the accumulated results of these slight advances are often highly interesting, beneficial and suggestive. Besides premeditated experiments, others are constantly being made in every section of this and other countries, without design, by chance or accident, and their results, whenever important or interesting, are generally noted and reported.

Moreover many of the best minds of the day have made a specialty of studies in every branch of agriculture, while throughout the civilized world, national and local governments have established special departments for systematic researches and experiments as to the best methods and appliances in all kinds of agricultural pursuits. By these means a vast fund of information on this topic is constantly being gathered from every part of the world; and conveyed cheaply to those who can be most benefited by it, through means of the Press. In the division of labor which the multiplicity of modern pursuits has rendered inevitable each avocation has special literary vehicles for the collection and interchange of thought and information of interest or benefit to it.

In this respect what the Scientific American is to the manufacturer and mechanic the RURAL NEW-YORKER is to the farmer; and no farmer fully alive to his own interest, and the spirit of the age, will be without this paper, or some other treating of his own occupation. It may not be policy to practice all any of them recommends, but each reader will not fail to find much of practical utility and importance. While every manufacturer and almost every mechanic takes some paper devoted to his own business, and each member of every profession does likewise, it is surprising how few farmers take agricultural papers. Yet no class stands so much in need of special information as the farmer. His life is, in a great measure, isolated, and his opportunities for acquiring knowledge orally, few and far between, while those in other pursuits are brought frequently together by the necessary conditions of their business and homes.

When excuses are given for this negligence the two most ready are hard times, and the necessity of curtailing expenses. Hard times in sooth! Why taking the paper and using its information diligently would be one of the most efficacious means of getting rid of these. What would be thought of an invalid who should refuse to incur the expense of a doctor on the plea that he was really too sick? The mere collection and statement of this information costs thousands every year, while many of the experiments which yielded it, have been protracted and costly, yet in the RURAL NEW-YORKER the most accurate accounts of every recent development in agricultural science is offered to the farmer, who imperatively needs just such information, for the pittance of $2.50 per year. Tobacco and many other useless or injurious indulgences cost much more than this unbegrudged.

These are selfish indulgences too, whereas the possession of a paper is not only a benefit and pleasure to one's self but also, a joy and education to one's children and an attraction to the household. And if we wish our children to follow in our footsteps we must add new beauties to farm life, we must furnish our homes with food for thought and knowledge, otherwise they will soon abandon the unattractive homestead and seek a precarious living far from us, in other pursuits, or be wrecked on rocks of which neither their experience nor reading has given them any warning. FRANK M. TERRY.

AGRICULTURAL CHEMISTRY.

UNDER this head in the last RURAL, Mr. MINER writes that the Professors of scientific agriculture, thus far have done little or nothing for the practical benefit of the farmer. This assertion, with slight qualifications, is probably correct; and no one can more deeply regret to acknowledge it than myself; for when scientific men began so earnestly within the past half century, to turn their attention to the investigation of the secrets of nature, I had sanguine hopes that as great and certain improvements might be made in the production of grass, grain, vegetable and fruit crops, as there has been in the manufacture of agricultural implements. But there is an apology for this difference of results. With implements we have something positive and reliable to work with. Here are wood, iron, and steel; and any one who knows how to shape and properly put them together is sure of what he wishes to accomplish. Not so with the products of the earth; for to begin with, science thus far has not been able to give us the exact elements in a soil, and what of these are available at the time of planting for the desired crops, so that precisely what is wanted for their perfect growth and ripening can be added if necessary to ensure these. Furthermore, we are greatly dependant upon the weather; for a little less or more of sunshine and rain makes a large difference in the quality and yield of crops. Of these we have no command; and can only supply the want of rain by irrigation in favorable localities. Plowing, planting, and the application of any sort of fertilizers are in vain, unless sufficient moisture and heat follow to render them available. Here are the uncertainties of producing such crops as we hope for at the time of planting, and I do not see how they can be avoided.

But to turn to Prof. ATWATER, to whose writings Mr. MINER refers. There may possibly be some errors in them, yet I desire to say, that I have derived one considerable advantage from a perusal of the German experiments he has taken so much pains to translate and elucidate for the agricultural public. I have a ten-acre water meadow, which produces only a species of sedge — *Scirpus pungens* — which is considered quite inferior to salt meadow grass: and any kind of live stock will almost starve rather than graze it. I cut and store this at a cost of $3 per ton. When I am farming upland hay, timothy, red-top, or clover is worth, on the average of years, $30 per ton. To make this sedge available and equal for fodder to prime upland hay, Prof. ATWATER recommends that a certain quantity of its weight of linseed or cotton seed meal should be added to it, aside from what other meal or bran we have been accustomed to give with the best quality of upland hay, to keep our horses and cows in good condition.

In accordance with the above recommendation, for 16 months past, I have fed my horses and, except when in pasture, my cows also, with every ton of sedge costing $3 at the barn, 400 pounds of linseed meal at $12, making the cost of the two $15, thus saving me $15 on every ton of sedge fed to my stock. I have also tried wheat and rye straw, with the same economical and beneficial results. My horses are in as good condition now and do the same work, and the cows give as much milk, and it makes as much butter of the same quality as when they were fed on the best of upland hay. Other information which Prof. ATWATER has given us from the German experiments have been of advantage to me, which I may speak of hereafter; and for one I heartily thank him for his excellent writings. AMERICO GERMO.

Field Crops.

WILL POTATOES RUN OUT?—FURTHER FACTS.

BY PROF. W. J. BEAL.

SOON after writing the first article on this subject, I received a card from Dr. ASA GRAY, inquiring, "What report do you get from Kansas and Columbus? Do you interpret your results as showing that potato varieties *tend* of themselves to run out?" I reply through the RURAL NEW-YORKER.

AS I am not much of a theorizer, I will give what additional facts I have received and let each one draw his own conclusions. I shall not venture to draw conclusions till I have repeated and tried more experiments. Since writing my report of experiments on potatoes, I have received a report from Kansas Agricultural College, where I had sent samples of our potatoes to test for comparison.

Prof. E. M. SHELTON writes:—"I inclose a partial list of the results by weight of the yield of the potatoes which you sent me last spring. These potatoes, one of each variety, were each cut into three pieces and planted in three separate hills on May 12. This was very late planting for this country—three or four weeks late on account of wet weather. The yield is very light. A part of the potatoes gave absolutely no yield, and a few others returned only three or four potatoes, no larger than marbles. These (he says) I have not reported. The potatoes were harvested Sept. 13."

COMPARISON OF RESULTS.

The reader must bear in mind that we planted and report the result of six hills of each variety—just twice the amount planted in the experiments in Kansas. On looking over that list and comparing it with ours, I find that among the twenty-five lowest on our list there are only four which are included in the Kansas list, viz.: Prince Albert, yielding 2 ounces for three hills; Sebec, 1 ounce; No. 2 Bush, 1 ounce; Early Shaw, 3 ounces.

In the list which he *sends* I find eleven out of twenty-five of those yielding least are raised from seed which we have raised for seven or eight years at our College.

On looking at the Kansas list to see which yielded best, I find the highest twenty-seven are all raised from seed which had been used only one year at our place, excepting two varieties, "Climax" and "Breese's King of the Earlies," the seed of which had been used here seven or eight years in succession.

In Kansas fifteen varieties yielded higher than Climax, and seventeen yielded higher than Breese's King of the Earlies. Both yield high with us.

Twelve out of twenty-seven yielding most in Kansas are among the list of twenty-seven yielding most at this place.

We expect a continuation of these experiments next year.

A GOOD WORD FOR THE ARTICHOKE.

ONE of the contributors to the London Garden, in speaking of the Jerusalem Artichoke, reiterates what we have already claimed for this plant. He says:

One cannot help wondering that a plant so prolific, and that can always, under all conditions and circumstances, in any kind of soil and with but little attention, be relied on to produce a crop, should have received so little attention as this Artichoke. However, such is the fact, and, except in the gardens of the wealthy, it is almost unknown. They might, however, have a trial, for although probably their peculiar flavor would not suit every taste, yet they might be made into soup or cooked in various ways, and in the winter they would furnish a desirable change of vegetables. Doubtless many have condemned them or refused to grow them without really knowing what they are.

Plant the sets like those of potatoes, in March, either with or without manure, according as the land is good or otherwise, or whether large or small tubers are required. Plant in rows 3 feet apart, 12 inches asunder and 6 inches deep. All that is necessary afterward is to keep down weeds till the tops get fairly into growth. About July the ends of the shoots may be shortened a little to keep them from flowering and within bounds, and to strengthen the crop. Some leave them in the ground altogether, and just dig a few when required. This, however, is a bad practice; they should always be lifted before growth begins. The best-shaped tubers should be selected for use and stored like potatoes; the others should be reserved for seed.

The Poultry Yard.

HOW TO MAKE DOMESTIC POULTRY THOROUGHLY MISERABLE.

THERE is no time like the present for making domestic poultry thoroughly miserable. The thermometer has taken a sad tumble in the last fortnight and those poultry-keepers who desire to make their fowls as miserable as possible, should not lose sight of the present excellent opportunity. It is a very easy task, and requires little skill or experience. Any farmer's boy of ordinary capacity can easily accomplish it after a little practice, and almost any farmer in the country can perform it to-day without any instruction. We will give a few standard rules for ill-treating fowls at the farm and will guarantee results. Many old farmers may complain that "these rules are nothing new—just what they've been doing for twenty years;" and to such as may make this complaint, we apologize for the staleness of our

RULES.

Misery No. 1.—Never feed your fowls until the sun is high and warm. By this means you insure utter misery in the fowl yard for at least three hours, for the chickens having risen (or rather descended) early, have the pleasure of walking about on an empty crop in the piercing cold of the early day, vainly searching for something to eat on the hard ground, to which everything edible is frozen solid. This will sharpen their appetites wonderfully, and the only means of adding to their misery is by allowing them to see you, through the window, eating a smoking hot breakfast near a warm fire.

Misery No. 2.—Come out of the house with a pail in your hand, call playfully to them, "Chick, chick, chick," and as they fly to you in their hunger, and expectantly cluster about you, quietly pass into the barn, fodder the horse and cow and pass back to the house without feeding them, leaving that hungry, disappointed, shivering flock waiting for your return.

Misery No. 3.—Let them wait, and don't return.

Misery No. 4.—Finally, when the sun is up, the meadows warmer, and the chickens have wandered away in sheer despair of receiving anything at home, take a plate of "scraps" to the side door, call "chick, chick," throw down the "scraps" within convenient distance of the house-dog and retire indoors. The chickens, though at a distance, are quick of ear, and will rush homewards in a hurry; but, though they are speedy of foot, they will only arrive in time to see the dog lazily licking his chops after dispatching the last morsel of the breakfast intended for them.

Misery No. 5.—If there is no running water on the place, put out for the chickens some water in a shallow dish on the shady side of the house. As chickens generally congregate on the sunny side of a building, they will not see the water at once and, by the time they discover it, it will be frozen solid.

Misery No. 6.—The only improvement on the former is, not to put out any water at all, making the excuse that "it would freeze if you put it out any way." This is on the excellent plan of the gentleman who declined to provide breakfast for his servant, for the reason that if he did, "the fellow would be just as hungry at dinner."

Misery No. 7.—Leave an old tub or pan under the eaves of the house. The melting snow on the roof will drip into this pan or tub and the chickens will drink of it. Melted snow will give fowls a painful affection of the throat, which will materially add to the pleasure of their existence.

Misery No. 8.—Cut no holes in the barn doors for the chickens. If these holes were cut they might enter and pick up in the stalls the grain scattered from the manger by the cattle. Be very careful to keep them out of the barn, or they will gather every wasted grain.

Misery No. 9.—During the long winter months, while nature deprives them of all green food, be careful to leave no cabbage heads or lettuce or celery tops in their way. They would relish these as would a ship's crew cursed with scurvy relish any green food; therefore, keep all such luxuries—nay, necessities—from them.

Misery No. 10.—Close up all the outbuildings early, that they may seek no warm corner for shelter when, as the sun goes down on their unhappy day, they fly to roost. Force them to roost in a leafless tree (being careful to have no warm evergreens on the place), or else in an open shed on the exposed side of the barn, where the winds can whistle about them until they are almost frozen dead upon the miserable perch, waiting drearily for the morning to come, which will bring them, not care and kindness from their owners, but the blessed sun of heaven, to warm and put some little throb of life into their chilled and trembling bodies.

If these ten standard rules are strictly carried out, we will guarantee results. What these results will be, we need not add. Unfortunately, these rules are more or less in vogue at seven out of ten farms in the country to-day, and the result is hinted at by the farmers when they tell you that "chickens don't pay."

Fortunately, there is a compensatory justice which avenges, in a weak way, the ill-treated fowls. Eventually, some of these wretched chickens find their way into the flesh-pot. Tired and hungry from his day's ride to market, the farmer sits down to a "chicken dinner." Mrs. Farmer ladles out a little warm well-water and a few polished bones, to which she gives the lying title of "chicken soup." Mr. Farmer adds a little pepper and salt, and after spooning it down his throat, has a sensation much the same as though he had been indulging internally in a pepper bath. This stimulating compound having been disposed of, something resembling a canvas-covered, cast-iron chicken frame, is placed before Mr. F. to appease his appetite. Let us hope that justice is meted out now: that as his knife slides over the sharp outline in vain endeavor to carve a dainty morsel from the shriveled form, some recollection comes to him of the neglected fowls at his door, from whom he can expect nothing now, as he vouchsafed nothing to them in their hunger. Let us hope that Mrs. Farmer insists on being helped to all that is available from the skeleton before them, and that Mr. Farmer goes to "roost," as have his chickens on the farm—tired, hungry and cross.

THOMAS W. WHITE.

Ridgewood, N. J., Dec. 11, '76.

HOW TO KEEP THE COMBS OF FOWLS FROM FREEZING.

DURING the piercing cold of winter the combs and wattles of many poor birds suffer disastrously from the sharp attacks of Jack Frost. The combless state of many a beautiful bird, ruined for the show pen, if not for the poultry yard, bears cruel evidence to the wanton carelessness of their owners.

A warm, though not necessarily an expensive fowl-house is indispensable to every farmer and fancier who wants his fowls to lay and pay during the winter. Those who keep single-combed varieties, and have not a warm house for them, can easily prevent their cocks' combs from freezing by simply having a roosting place, built like a smaller house inside their poultry house. By this means, during weather exceptionally severe, the birds can be shut up, temporarily, in a snugly confined area, and a couple of panes of glass will allow them to see easily while eating, so long as the danger lasts.

This inside house need not take up any of the room ordinarily used by the fowls, but can be constructed on posts so as to occupy no floor room. A neighbor has tried this and it works admirably. His has two chambers. The upper for roosting purposes, with low perches and a sliding bottom to facilitate the escape of droppings, is furnished with doors that open all along the front. The lower chamber has an alley along the back, and nests at the front with sliding doors to each so that the eggs can be readily collected. A hole in each end of the top and bottom compartments allows the birds to pass freely in and out. The partitions between the nests are loose, so that any required nests may be shut off from the others. Properly white-washed, this can be kept quite sweet, and would save many a fine bird at a very trifling cost of time, trouble or money. H. H.

REARING POULTRY.

I HAVE been much interested in the description of Mr. BELDON'S method of rearing poultry, by your English correspondent, Mr. WHITE. It seems that cleanliness, pure air, exercise, and judicious feeding are the great secrets of his success; and with these, any accommodations however humble, if dry and well sheltered, answer the purpose. I scarcely ever saw a poultry house, however expensively built, that had sufficiently high rooms to ensure a pure atmosphere, especially in cold or stormy weather, when it was necessary to close some of the windows or ventilators.

My farmer's wife wintered 31 hens this year, and from these she has raised the present season nearly 400 chickens. All the accommodation she has for these is a roomy shed, open entirely to the south, for laying and hatching, and a small airy building at the west end of this for roosting. Her coops for the hens with chickens are old barrels, turned down on the side, with slats in front to keep in the hen, while the little chicks can run in and out between these at pleasure. The soil is a light gravelly loam, and pasture grounds surround the poultry shed.

Here is an abundance of pure fresh air at all times and a dry footing and shelter. Strict attention is paid to feeding the chickens regularly as often as required, and the feed is plain and wholesome. The percentage of loss by disease among these chickens has been so small this season, as not to be worth mentioning—in fact, they may be said to have had no diseases at all—a few only having been lost by accident.

Dec. 12, 1876. A POULTRY FANCIER.

The Herdsman.

ON FATTENING STOCK.

AT this season the fattening of many an old and young animal for the butcher is in progress, and anything which will throw light upon the subject is of general interest to the farmer. The English Agricultural Gazette, in speaking of the various substances which are converted into fat or flesh in fattening animals says:

The fattening properties of starch, sugar, and fat or oil are thoroughly known and appreciated. All these substances are so familiar to us that, wonderful as are their properties with reference to animal nutrition, they do not come before us, like many chemical compounds, not only as strangers, but as strangers disguised in Greek and Latin syllables. Let any one place side by side a lump of sugar, a piece of gum arabic, a fragment of starch, and a small piece of beef suet, and he has before him four of the most important carbonate hydrates employed in the fattening of animals. Let him add a small piece of linen, or of cotton, and he has a pure specimen of cellulose, which although in too mature a form to be considered digestible, is yet capable of being converted into sugar by simple chemical processes.

Such a collection will, no doubt, assist him to understand the composition of such a familiar food as barley meal, which contains 60.4 per cent. of starch, 1.2 per cent, of gum and sugar, 2 per cent. of fat, 9.7 per cent. of crude fibre (cellulose) and bran. To these must be added 9.3 per cent. of albuminoids; and the remainder of the 100 parts is made up of 2.4 per cent. of ash, and 15 per cent. of water.

In order to understand the nature and uses of the albuminoids, we should add to the simple substances above enumerated a small cup of white of egg, or albumen; a piece of fresh curd (caseine); and a substance less easy to obtain, but which may be readily collected by washing clotted blood until the coloring-matter has disappeared, leaving the fibrine.

The albuminoids are, then, fairly represented by albumen, caseine, and fibrine. It is a most remarkable fact that these substances, all of which we have represented as of animal origin, have their counterparts in vegetables. Thus vegetable albumen exists in the juices of all plants, with properties almost identical with those of animal albumen. It coagulates when heated, and exhibits the reactions peculiar to animal albumen when brought in contact with chemical re-agents.

Vegetable caseine, or the pecular material of cheese, is also found in the food the cow is fed upon. It occurs abundantly in beans and peas, under the name of legumine, and in oats as avenine: and it is related that the Chinese actually make a vegetable cheese, which, when salted, pressed, and kept, develops the peculiar flavor and smell of cheese.

Vegetable fibrine can be separated from the gluten of wheat, potatoes, &c., and is almost identical with animal fibrine.

These bodies constitute what are spoken of by agricultural chemists as the nitrogenous constituents of food, and as flesh-formers, in contradistinction to fat-formers. They are of almost identical composition, all consisting of carbon, hydrogen, nitrogen, oxygen, and a little sulphur associated together in the same proportion.

Albumen occurs in the serum of the blood, in blood-corpuscles and all the fluids of the healthy body, except the urine. Caseine is abundantly developed in the secretion of milk, and has been detected in the brain of animals. Fibrine occurs abundantly in the blood as blood-fibrine, and in the muscles or lean flesh under the name of flesh-fibrine.

No one, then, can doubt the importance of the albuminoids as constituents of the food of stock. They are always present, but when they occur in considerable proportions, as in beans, lentils, and cakes, the food is known as highly nitrogenous. On the other hand, when the non-nitrogenous constituents prevail, the food is spoken of as non-nitrogenous.

The relative importance of these two classes of food ingredients is a matter upon which leading scientific men are not agreed. Both are certainly essential, and for the fattening of adult animals the so-called non-nitrogenous foods seem to be best fitted. As already pointed out, the subject is not closed by this admission, for the manure produced from higly nitrogenous foods is much superior to that produced from farinaceous foods. Mr. Lawes is inclined to think that the best proportion in which the nitrogenous substances can be introduced into stock foods is the proportion in which they exist to carbo-hydrates in the cereal grains, which is about 1 to 6.

Young animals require a larger proportion of nitrogenous compounds than mature animals, as has been proved by direct experiment in Germany. This conclusion is in accordance with reason, for the juices of the body are more constantly called upon to supply material for the formation of muscle in a young and growing animal than in a mature one. Mr. Lawes found that when pigs were put up to feed with a choice between highly nitrogenous and comparatively non-nitrogenous food, they gradually inclined more and more to the non-nitrogenous food in the later stages of the fattening process.

Dairy Husbandry.

THE TRUE WEIGHT OF MILK.

X. A. WILLARD:—What is the weight of a gallon of milk. In the RURAL for Nov. 4th, under the head of "Comparative Value of Milk for Cheese in England and America," you reckon it at 8 pounds 9 ounces. In the creameries of Northern Illinois I found they reckoned it from 8⅝ pounds to 10 pounds to the gallon. Col. WARING puts it at 1 15-100 pounds to the pint or 9 pounds 3 1-5 ounces to the gallon. Is the trouble owing to the indiscriminate use of wine and beer measures? It seems to me there is great need of a standard and I had always considered the 1 15-100 pounds to the pint a standard, though I know not why. Give us some light on this subject.—L. S. HARDIN, *Louisville, Ky.*

REMARKS:—There are several reasons why milk weighs differently when weighed by different persons. In the first place the same temperature of the milk is not observed at the time of weighing; then again the measures used are not all accurate, and when accurate some persons are not careful enough in filling the measure, or in having perfect scales so adjusted as to weigh to the fraction of a grain. The milk of different cows does not all weigh alike at the same temperature. What we seek therefore is to get the weight of milk of average quality and such milk perhaps is best obtained by mingling that from several cows or of a herd together, and then taking a given quantity and accurately measuring and weighing it.

A few years ago, while on a visit to the late GAIL BORDEN, the distinguished inventor of the process for condensing milk *in vacuo*, the question as to the weight of a quart of milk came up. Mr. BORDEN said he had taken great pains to get at the truth of this matter and to settle it beyond cavil, and for this purpose he had conducted a number of experiments. In the first place he tested from time to time different herds, seeing the cows milked under his own eye to make sure that the milk was absolutely pure and unadulterated. Then, when the milk of the different cows had been well mingled together, he took a given quantity and had it measured and weighed at the office of the United States where the accuracy of weights and measures are determined. The milk was reduced to 60 degrees Fahr., and then carefully measured in standard measures of the United States, and then weighed in delicate scales under glass. After repeated experiments of this kind—the milk of different herds being taken at different times—he found that three pints (wine measure) of average milk would weigh three pounds three and three-eighth ounces (3 pounds 3⅜ ounces). A quart therefore weighs two pounds two and two-eighth ounces (2 pounds 2 2-8 ounces) and a gallon eight pounds nine ounces (8 pounds 9 ounces.

Any one who was acquainted with GAIL BORDEN, and was familiar with his manner of making experiments, would never for a moment question their accuracy. He worked with all the caution and skill of the trained scientist. He did not rest satisfied with one trial but verified the accuracy of his work by repeated experiments. We regard Mr. BORDEN as the highest authority on the weight of milk, and have therefore taken his figures as the true standard in our remarks concerning the weight of this article in the RURAL. We are glad our esteemed correspondent has brought this question to our notice, because it is important that some standard as to the weight of milk be recognized.

In some sections we notice milk is measured by the beer gallon; these are exceptional, the more general use being *wine measure.* We think wine measure should be the standard measure for milk, though we do not remember to have seen any statutory law in regard to the matter in any of the States. The use of wine and beer measures indiscriminately is certainly confusing and leads to much misunderstanding. This was the case at the early inauguration of the factory system in New York, and as trouble grew out of it the factories adopted the plan of weighing the milk, which leaves no chance for dispute.

We should be glad if many other articles besides milk were bought and sold by weight instead of by measure. A heaped bushel is an indefinite quantity depending on the liberality of the seller in rounding up his measure.

THE ENGLISH DAIRY FARMER.

VERY different from his Cisatlantic cousin is the English dairy farmer. Not for him the long day's work in summer following the plow and cultivator and elevating the hoe! Not for him the winter's morning with almost frozen feet and fingers attending to the comforts of his cattle and providing for their necessities! All his ideas of work are comprised in milking six or eight cows twice per diem, helping to cure and draw the hay during the harvest season, riding or walking around on his farm overlooking his cattle and superintending his "workmen" during the forenoon, and in the afternoon inhaling the fumes of the best tobacco out of a long "churchwarden" pipe.

If he is a young man he will probably belong to the village cricket-club, which will give him employment two or three evenings a week, and prevent him from totally stagnating. So much for the summer programme! In the winter he will presumably be stowed away beneath the blankets until about 7 A. M., delegating the milking—of which there is at this season of the year not much to be done—to the "workmen." After breakfast—should he have sporting proclivities—he will, taking his dogs and gun, ramble down among the lowlands and watercourses in search of water-fowl.

If in pretty affluent circumstances a ride to hounds once or twice a week will be indulged in, and it may be, he will invest a couple or three thousand dollars in blooded horseflesh and carry off the plate at the provincial meeting. Anything of a menial character, such as carting manure, currying and harnessing his horse, or even blacking his own shoes, he has a special aversion to and prefers paying a servant to waiting on himself.

In addition to this, he is—according to his own ideas of what in that term is comprised—eminently respectable, pays his debts as they become due and perambulates his demesne in a good-looking suit of clothes. "Overalls" and "butcher frocks" he greatly abominates and as to slaughtering any of his own animals that is totally out of the question. When such work has to be done the services of a butcher are brought into requisition, but that seldom occurs, the superfluous stock being sold with the breath of life still in their nostrils and rebought as meat at a considerably increased price.

Attending cattle markets and fairs has special charms for him, with which, and visiting his acquaintances, he manages to keep the muscles of one, two or it may be three roadsters in good traveling order. His equipage is usually a "dog cart"—a two-wheeled vehicle of light construction and flashy appearance—which, owing to the hight of its wheels, runs smoothly over the macadamized roads when drawn by a tolerable roadster, at the rate of ten or twelve miles an hour. Altogether,—and looking at the case in every way,—the English dairy farmer has a very pleasurable existence, and whether out of the same amount of capital and exertion any other class of persons go through life as easily and enjoy it so much, is doubtful.

SON OF AN ENGLISH FARMER.

REQUISITES IN DAIRY FARMS.

A CORRESPONDENT who proposes to go West and engage in dairying desires to know "What are the essential requirements of a good dairy farm."

In the first place the land should be well adapted to grass, and sufficiently undulating or rolling so that surface water will be readily carried off. Land that is naturally wet and full of swales or low swampy places may possibly produce grass plentifully, but such grass will be inferior for pasturage. The best milk will be made on upland or well-drained pastures, but the soil should have enough clay in its composition to be retentive of moisture without being wet; for if it be too sandy and dry, grass will fail as warm weather approaches, and the feed in summer will be parched and brown and liable to be too scanty for the full sustenance of the stock.

A clay loam is perhaps as good soil for dairy purposes as can be had, though any soil where grass is enduring and is not subject to the objections we have named will be well adapted to dairying, providing it is supplied with springs or streams of never failing water. In our remarks we have had especial reference to pastures, but it will not be necessary that the whole farm be of the character we have described, for the meadow lands, or those to be used for growing hay, may be more moist or wet than the pasturage. Not unfrequently large crops of hay are produced

from low and rather wet lands; hence, if a portion of the farm is of this description and can be used for meadows, it need not be considered so very objectionable in case the pastures are of a different character.

Good water in abundance is another essential requirement of a dairy farm. It should be unfailing and well distributed over the pastures so as to be of easy access to cattle. Springs and streams of sweet, clear water are, of course, the best, though we have seen good dairy farms where the water supply was obtained from wells. In this case wind-mills were erected to pump the water from wells that were unfailing, and by arranging the vats or reservoirs so that the overflow could be conducted back again to the well, a constant supply of good, fresh water was kept within reach of stock.

Wind-mills are now built so as to be very efficient in their operation, requiring but little attention. Still, it will be seen that all such artificial means of procuring water are much inferior to a living spring or stream, to say nothing of the extra expense entailed to keep up the needed supply. The necessity for a good supply of clean, sweet water is imperative for the successful management of dairy stock, and no matter how good the farm may be for grass, or however eligibly located, if it fails in a sufficient water supply it will lack one of the most essential requirements of a good dairy farm, and one that will be sure to be fatal to a successful prosecution of dairying.

Water is sometimes so located on farms that a good supply is furnished in pastures remote from the stables while little or none can be had at the latter place for stock. This will be a serious inconvenience even in summer, but in winter it will prove an insuperable objection, because cows that are obliged to travel long distances in the fierce blasts of winter, wading through deep snows, exposed to the intense cold of our Northern climate cannot be expected to be carried through the season without heavy loss. In choosing a dairy farm then, look well to the winter as well as the summer supply of water. Another essential requisite in a good dairy farm is that the farm be not so situated that the cattle are obliged to travel long distances from the pasture to the milking-stables. All excessive travel is a waste on the tissues which will be made up at the expense of milk secretion, and hence such dairy farms are objectionable.

We should suggest also that our correspondent take note of the amount of fencing that the farm will require. We are acquainted with some excellent grass farms that are so located as to require an extraordinary outlay in the building and maintaining of fences. In such cases a heavy draft is made on the annual receipts in keeping up fences. We have named some of the leading requirements of a dairy farm without going into detail. It is desirable, of course, that farms be so shaped with respect to buildings that the labor required in their management be comparatively light. Accessility to market or to villages is another convenience which should not be overlooked, and above all select your farm in a healthy locality.

DAIRY CONVENTION.

NEW YORK STATE DAIRYMEN'S ASSOCIATION.

ELMIRA, N. Y., Dec. 13, 1876.

A MORE delicious day for the assembling of a Convention than we have had to-day could hardly have been made to order. The air was balmy and soft, yet sufficiently bracing for comfort. The effect of the weather was plainly perceptible on the face of my genial friend Harris Lewis, whose smile was as sweet as if he were not responsible for any of the "ways that are dark and tricks that are vain" for which the Dairy Ring of last summer has made itself so famous. Under the cheering influence of Old Sol's bright rays, the solemn countenance of our august friend and so-called Professor Arnold assumed a smile at once so bland and bewitching that one would never dream of his having taken part in the wayward and phantasmal doings at Philadelphia some few months since. Blanding, the great Dairy Architect, who erected the $10,000 building which sold for $1,100, seemed to be above the influence of Elmira's brightest day, and poor Scoville appeared to be quite used up by his past summer's labor. Shull smiled and, as usual, looked wise. How some people *do* succeed in building up a reputation for wisdom by keeping still!

The citizens of Elmira secured for the accommodation of the Convention the Academy of Music, a beautiful little structure, admirably adapted to the purpose.

MORNING SESSION.

At 11 o'clock President Willard called the meeting to order. The brief morning session was devoted to preliminary business, including the appointment of committees. The following committees were appointed by the Chair:

Order of Business.—Col. C. P. Root, Gilbertsville, Otsego Co.; Dr. E. G. Crafts, Binghamton, Broome Co.; Col. H. C. Hoffman, Horseheads, Chemung Co. *Finance.*—George W. Hoffman, J. S. Van Duzer, W. A. Ward, all of Elmira. *Miscellaneous.*—Jesse Owen, Elmira; Joseph W. Long, Oxford, Chenango Co.; J. V. H. Scoville, Paris, Oneida Co. *Resolutions.*—H. M. Kennedy of the Utica Herald, G. A. C. Barnett of the Rural New-Yorker, J. M. Peters of the Grocer, New York. *Dairy Apparatus.*—Wm. Blanding, Hawleytown, Broome Co.; Col. H. C. Hoffman, Horseheads, Chemung Co.; W. L. Rutherford, Waddington, St. Lawrence Co. *Dairy Products.*—T. D. Curtis, Syracuse; Jesse Owen, Elmira; Hon. Harris Lewis, Frankfort, Herkimer Co.

An adjournment was had till 2 o'clock P. M.

AFTERNOON SESSION.

On the assembling of the Convention in the afternoon there was a slight increase in the attendance, although it was still a thin house—dairy-men from the outlying towns having apparently failed to appreciate the importance of the meeting. A few ladies appeared; but, altogether, there was but a poor showing for a district famous for its dairy products.

President Willard entered the Hall, accompanied by Secretary Shull, President Hoffman, of the Farmers' Club, and his honor, the Mayor. Mr. Hoffman introduced Mayor Turner, who tendered to the Convention and its visitors a cordial welcome. He also made a comparison between the dairy interests and those of all other industries, very favorable to the former. Touching upon the present prices and future prospects, he predicted brightly for the dairymen of this State.

To this address President Willard made a neat reply on behalf of the Association and then delivered his annual address, which was listened to with marked attention and deep interest. As you will probably publish it at a future time, I will omit any further remarks upon it.

This was followed by a rather heavy but exceedingly interesting paper by Dr. Crafts of Binghampton, on Mammarial Glands. The Dr. seemed to forget that few of his audience were acquainted with the scientific and technical terms used by physiologists; but the audience bore up well under it, knowing the Doctor's earnestness and zeal for the promotion of good dairying.

The discussion which followed this paper was principally upon the use of the metal milking tubes, the use of which almost all the participants deprecated and few defended. The general opinion and experience seemed to be that their use resulted in garget and should be discountenanced. The discussion lasted no inconsiderable time, and was sustained in an animated manner by Messrs. Arnold, Stiles, Crocker, Curtis, Owen, Hoffman, Stowell, Miller, Johnson and Dr. Crafts himself.

Dr. E. L. Sturtevant sent his paper on Ayrshires, which was read, in his absence, by Mr. T. D. Curtis.

The discussion which followed showed the interest it excited, and must have made Col. Hungerford's ears burn if he is at all sensitive to electric influences. The celebrated cow, "Creamer," was claimed to be all breeds and no breed, admitted to be the best cow ever seen, and finally consigned, by Harris Lewis, to his usual receptacle for all good cows, the Short-Horns. Had Col. Hungerford been present, there might have been a different tone maintained; but, in his absence, his exhibition of Creamer as an Ayrshire, did not appear to meet with general approval. The discussion was participated in by Messrs. Rutherford, Hoffman, Lewis, Ward, Stowell, Scoville, Crafts and Miller. This closed the afternoon session.

EVENING SESSION.

The proceedings were opened, Dr. Crafts presiding, by a paper upon "The Holstein Cow," prepared by Garrett S. Miller of Peterboro, N. Y. and read by Mr. Armstrong of Elmira. His three imported cows gave an average of 8,738.28 pounds per year for the six years he has owned them.

Dowager gave milk 1884 days during the six years and produced 53,805½ pounds. Crown Princess was in milk 1821 days and produced 61,-112 pounds, a daily average of 33.56 pounds. The highest daily yield was 76 pounds, her largest annual yield was 14,027 pounds.

Following this, Mr. Hoxie, of Utica, N. Y., presented a statement, showing the yield for the season of 1876, of the thoroughbred Holstein cows owned by the Unadilla Valley Breeders' Association:

Name	Yield for 192 days.	Record from time of calving to Dec. 8.	No. days.
Maid of Twisk	9,653¼	10,349⅝	211
Jocoba	6,473⅜	7,885⅜	236
Sijtje	6,284⅜	7,243⅛	220
Nelitza	5,337½	6,748½	241
Jenka	4,335⅜	5,265½	228

Here followed a discussion, which contained the relation of many valuable experiences, but which had to terminate to admit of the reading of Mr. Harris Lewis' paper on "Short-Horns for the Dairy."

Mr. Lewis opened gracefully, as he always does, in the following language:

In presenting this subject for your consideration, I cannot do better than to give you a brief history of some of the early efforts to improve the Short-Horns, by quoting from a paper read before the Blanford Farmers' Club, in October last, by Mr. Daniell, and published in the Mark Lane Express of October 30th, 1876, a copy of which was kindly sent me by one of the publishers of the RURAL NEW-YORKER.

The subject was handled in a convincing manner, and I must send you the following extracts:

"Very many predict that the fashionable breeding of Short-Horns, as it is called, will have its day, considering it as a matter of speculation merely. This may be so; but I predict that so long as the yearly offspring of the fashionable cow will sell in the market for from ten to ten hundred times as much as her annual yield of milk is worth, the present course of breeding will be continued, if every drop of milk should go to grass. * * * * *

"To sum their milking qualities up in a nutshell, I will declare them capable of giving from one pound of milk per day to one hundred, if the records here be true, and that the quantity of milk they produce is in exact proportion, as a rule, to their breeding, food and care. And this very quality, possessed by them in a greater degree than by any other breed of cows, adds vastly to their value as dairy stock. * * *

"I prefer the Short-Horn cow for the dairy because she will produce the most milk, the most butter, the most cheese, and the most beef, for the food consumed, of any breed of cows we have."

After a discussion upon the subject of this paper, which was quite spirited so far as Mr. Arnold and Mr. Lewis were concerned, the Convention adjourned for the day.

I shall send you the proceedings of to-morrow as soon after the adjournment as the Erie Railway will permit. SHORTHORN.

[The remainder of the proceedings have arrived, but too late for this issue, and must lie over till next week.—ED.]

Scientific and Useful.

PARAGUAYAN TEA OR YERBA MATE.

IN many an old book of travels mention is made of the above named substitute for the genuine tea of the East Indies and China, but we do not remember to have met so full a description of it as lately appeared in the Planter's Journal, from which we make a few extracts. We may add however that *Ilex* here referred to is the botanical name of our common evergreen Holly found growing abundantly from the latitude of New York city southward, and it may be that our native species would make just as good tea as the Paragnayan.

At present the *Ilex Paraguayensis* is to be found solely in Southern Brazil, where it grows wild. There are two or three allied species of *Ilex*, natives also of South America, that possess similar properties to the *Ilex Par.*, also used for tea. One of these is the *Ilex Martiniana*, indigenous to British Guiana; another is the *Ilex Gongona* of Brazil. Specimens of the *Ilex Par.* and of Chinese and Indian Teas can be seen side by side at Kew Gardens; the leaf of the two plants is almost identical, the former being larger. In their wild state the trees are about the size of orange trees. The trunk is about two or three feet in circumference, and has smooth whitish bark; and the boughs, which resemble those of the laurel, are leafy and tufted. The leaves are evergreen, and at their full are about four inches long, thick, glossy, and crenate at the edges, of a dark green color above, and paler underneath. The flowers are small and white, growing in small clusters. The berries are red, very smooth, and similar to the Christmas holly. The leaves of this *Ilex* yield the same bitter principle, *Theine*, which is found in the Chinese tea plant. Although the former may not afford so much of the agreeable aromatic oil as the latter, in consequences of the careless and primitive manner in which they are collected and prepared for use, yet they produce a most agreeable and refreshing beverage, which forms the staple drink of the South American Republics, and it has been much relished by Europeans visiting those countries.

Tea-drinkers in China are weak and thin; but with mate this does not occur, and the people of the Southern Republics, where the use of mate is carried to an abuse, are robust and healthy. In cold climates mate is very good as a beverage—its promotion of diaphoresis, alleviating bronchitis and pulmonary irritations. In hot climates it is still more proper as its diuretic action favors the reduction of the abdominal viscera, especially the liver, to enlargement of which people in hot climates are very liable. As far back as the seventeenth century the *Yerba Mate* was commonly drunk throughout the State of Paraguay. There can be little doubt but that the aboriginal Indians taught the use of this tea to their Spanish conquerors, and the early Jesuit missionaries planted great numbers of these trees before their expulsion, since which time its cultivation has been neglected. The most abundant groves of the *Yerba* are situated in districts exposed to the raids of hostile Indians. Expeditions start from Asuncion to the *Yerba* groves, a distance of 200 miles, and are generally composed of forty to fifty persons, mounted on mules, having with them other mules and bullocks. On reaching a locality where the trees are abundant, wigwams are erected and the *tatacua* constructed. This consists of clearing a small space of ground, the soil of which is then beaten down with heavy mallets until it becomes quite hard and level; at the four corners of this space sticks are driven into the ground, from which a sort of net, made from strips of hide, is stretched; a fire is kindled beneath, and the leaves on the boughs, as they are brought in from the surrounding forests, are scorched by being placed on the net, care being taken that no ignition takes place.

The scorched leaves and small twigs are then ground into a coarse powder by means of a rude wooden mill—frequently stamped with blocks into dust—after which process they are ready to be weighed and put up into packages for export. Half a bullock's hide in a green state is used to form a kind of sack to hold the tea, being first sewn up at the sides. The tea is then pressed down until it is quite full, the mouth is sewn up, and the package, which usually weighs from 200 lbs. to 250lbs., is left to dry and tighten in the sun for a few days, until it becomes as hard and impervious as a stone. Such a mode of collection and preparation is indeed primitive, and the twigs impart a woody flavor to the tea, otherwise very agreeable.

The tea is made by simply pouring boiling water over the tea-dust, and allowing it to stand for a few minutes. Besides the Paraguay consumption, about 1,250,000 lbs. are taken by the Argentine Republic, and the second kind is exported round Cape Horn to the other South American Republics. We have no correct data for determining the quantity annually exported from Paraguay; but it is stated that about 8,000,000 lbs. are sent to Santa Fe and Buenos Ayres, whilst Chili consumes 40,000 arrobas (32 lbs. each) yearly, and Peru 100,000.

PRESERVATION OF TIMBER.

THE Building News gives the following valuable information: Presuming the timber has been felled at the proper time and stacked with care, and is delivered in a good state ready for the builder, the means employed to preserve it are various, and must depend in a great measure upon the nature of the work for which it is to be employed. For instance, if it is for external work of a common character, the best preservative is to well paint it, and, while still wet, strew it with sand, and, as soon as the paint has perished, repaint it. For posts and piles exposed to the action of moisture in a great degree, the best means is to char the wood, as it then in a measure becomes incorruptible.

Simple advises scorching the wood all over, and, while still hot, rubbing it with linseed oil and tar; the scorching can be effected by passing over the timber a powerful flame produced by coal gas and a blow pipe. As a preservative against worms nothing can be done better than to saturate the wood with any of the oils. As to the patent methods for the preservation of timber, there is one by Kyan, patented in 1832, which consists in impregnating the timber with corrosive sublimate, and another of a similar kind patented by Payne in 1841. The best preservative for timber I can recommend is (after having obtained the best seasoned, and when worked for the various purposes required), for it to be well rubbed with oil, and, when framing it in its place in the carcase of the building, taking care to keep it as much as possible from the masonry, and allowing the circulation of plenty of air without being liable to action of the weather, and when the carcase is complete, allowing it to stand as long as possible before the timbers are covered in, so that they may have as it were, a second seasoning.

Wet and dry rots are two forms of decay which attack timbers exposed to the action of the weather, and the cause of both may be said to be heat with moisture. Confined air and evaporation wet-rot. As a preventive against these rots the timber should be well seasoned, and if used where liable to be under the influence of sun and rain, should be well painted. If not painted they must be impregnated with linseed or oil of tar; but the best preventive is to allow a free circulation of air around the timbers, and the walls to be allowed to dry thoroughly before the introduction of the timbers. Should the timbers have taken either of these rots very little can be done to preserve them. If the rot is perceived to be at the end of beams only—and here it generally commences—the best way to preserve the rest of the timbers would be to cut away the

decayed portion and scarf with sound. Should this not be practicable, the wood should be scraped and cleaned of all fungus or extraneous matter, and then impregnated with any of the oils, or some of the patent methods referred to above.

COMMERCE IN DATES.

Mr. Witherby, in his "Report on Dried Fruits" shown in the food collection at the London Exhibition, 1873, observes—"The date is sent to us by thousands of tons, supplying material for food, for distilling, and for confectionery purposes. It is the delight of the schoolboy, the competitor of nuts at country fairs, and the *piece de resistance* of the London street stall in the winter and spring, when no fresh fruits are attainable. Dates prove what can be done with a fruit free from all Custom's restrictions, for they are free, untaxed produce of the earth, delivered to our consumers with no charges on them beyond freight and a moderate profit to merchants."

The date is the special tree of the Saharan regions. Its constitution temperament, and habits particularly suit it to the African climate, which is especially characterized by the deficiency of rain and the digressions of temperature. Its fruit is the source of sustenance for the nomad or sedentary people, white or black, scattered over its immense countries. The dates, after having been gathered, are dried in the sun, and when quite hard, buried in the sand. They may thus be preserved about two years; but generally after eighteen months they are attacked by worms, and in the beginning of the third year nothing remains of them save the stones. As an every-day food, dates are considered very heating, in consequence of which they are not much used on journeys, as causing great thirst. The most relishing and wholesome way to eat them is when made into a paste mixed with barley.

The date palm, cultivated and attended to from time immemorial, has produced in the hands of the natives as many varieties as our most carefully cultivated fruit-trees. There are reckoned not less than ninety varieties of dates in the Zibans. The different dates are of almost every color except pure white and black. There are not, as is the case with our apples and pears, early and late sorts, but all arrive at maturity about the same period (restricted to within a fortnight), which falls in Fezzan about the latter part of August. The fruit is the common food of both man and beast; camels, horses, dogs—all eat dates. Besides the dates destined for home consumption in the country, dates of a superior quality are gathered, and, being prepared with great care, fetch a higher price in the markets of Europe.

ARTIFICIAL DIAMONDS.

Many pastes have been devised for the preparation of these beautiful stones. None have been able in their products to equal the natural diamond in hardness and brilliancy; but nevertheless, to an unpracticed eye, the imitation is so perfect that the difference cannot be distinguished. The following formula for making a diamond paste is said to be one that gives the most satisfactory result. It is called Loysel's paste:

Take pure silica	100	parts.
Red oxide of lead	150	"
Potash, calcined	30	"
Borax, calcined	10	"
Arsenious acid	1	"

This produces a paste which has great brilliancy and refractive and dispersive powers, and also a specific gravity similar to that of the oriental diamond. It fuses at a moderate heat, and acquires the greatest brilliancy when remelted and kept for two or three days in a fused state, in order to expel the superabundant alkali and perfect the refining. This paste is used not only to produce factitious diamonds, but other factitious gems besides, of which it forms the basis.

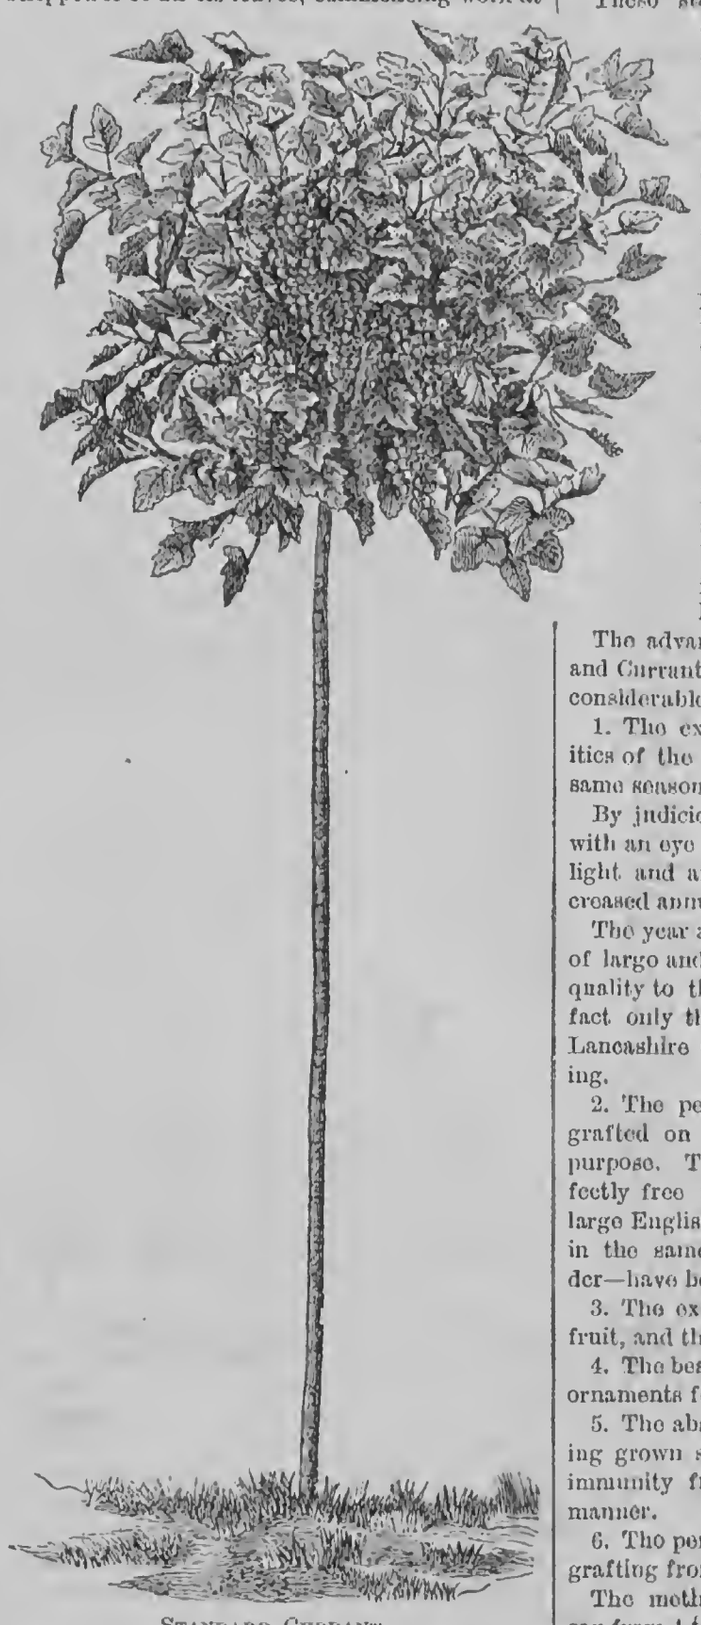
Entomological.

LEAF-EATING ANTS OF TEXAS.

Having received some time since specimens of a peculiar-looking ant from one of our esteemed correspondents in Comal Co., Texas, we wrote him, asking for notes on their habits, and the following is his reply, which we think will interest our readers as it has ourselves:

As it is your wish that I should relate what I know of the Leaf-eating Ants, I shall do so. These ants differ from all others that I have seen, in that there is such a difference in their size. I have seen them from an eighth of an inch to nearly three-quarters of an inch in length. The latter have a horny substance on their heads, which, if one tries to kill them with the fingers, is sure to prick the skin and give a sharp pain.

All the ants, even the least, are engaged in foraging or in opening passages, except the largest, which appear to be overseers or taskmasters, for when the smaller ants are foraging, they (the larger ones) are continually hurrying up the bearers of burdens. I have on several occasions seen the larger ants carry large grains of corn, but this was only because the burden was too heavy for the smaller ones to carry. Sometimes they work only in the day-time, and then again only in the night. I have a large China tree in my yard, and two years ago they stripped it of all its leaves, commencing work at



Standard Currant.

dusk and quitting at break of day. They are particularly fond of peach leaves. I have seen them on oak, pecan, hackberry, etc. They are also very fond of pinks, and will shear a plant in a very short time. Wheat is also a desirable article of food with them. I had some in a box in the upper part of my house. They found it out and soon had a large force at work, but I stopped it by devoting an hour's time to them, killing all goers and comers.

These ants are numerous along the river, in places where the subsoil consists of yellow clay. Their nests can be seen at a considerable distance. The little hillocks of yellow clay attract the attention of even a careless passer-by.

There are two nests in my field—one an old one, the other new. They are, together, thirty feet in diameter. The heap of clay that the ants have brought to the surface is a foot and over in hight. When it is not raining, there is constant work going on at the numerous holes in the mounds, thousands of ants being on the run carrying out little lumps of clay and depositing them a few inches from the holes. Those who go foraging neither go out nor come in at the holes over the mound, but at holes some distance from it. These are openings about the size of a dime and have no clay about them. I have seen such holes more than a hundred yards from the mound. What the depth and extent of these nests may be, I have no idea, but, judging by the mass of clay that lies on the surface, they must be of considerable extent. The crust on the surface is about two feet thick, as is shown by old nests that have caved in. Such a nest caved in in my pasture, and fearing that some animal might in the night fall in and break its leg or neck, I had it filled up with stones. It took a load and a half to fill the cavity.

Another ant that we have here does not injure trees, but everything in the plant line is carefully removed for some distance around its hole. No grass, grain, cotton, or corn is suffered to grow. These spots vary in size, being from three feet to eight feet in diameter. The ants, old and young, are nearly all of one size. I have tried various means to rid myself of these pests, but thus far boiling water is the best. For want of the right name, I shall call these "The Shavers." John A. Frichele.

The Garden.

THE STANDARD GOOSEBERRIES AND CURRANTS.

It is now about twelve years since the method of grafting Gooseberries and Currants as standards has come into general use in Europe, since which time these have been steadily increasing in public favor.

These standards have been tested in this country for the last seven years, in different parts of Hudson County, N. J., with the most satisfactory results, not a single case of mildew having occurred during the time stated.

The first plants of these standards, as the Rural has already stated, were imported to this country by Dr. Chas. Siedhof of North Hoboken, N. J., who has gradually increased the original six to fifty.

In '69 I went to Germany to attend the Pomological Institute of Dr. Lucas, at Reutlingen, and there saw these standards for the first time. Knowing the interest Dr. S. took in such matters, I immediately wrote him about them, the result being an immediate order from Dr. S. for half-a-dozen of them.

The advantages of growing the Gooseberry and Currant as a standard are numerous and of considerable importance.

1. The extraordinary and early-bearing qualities of the plants, they very often bearing the same season they are set out.

By judicious treatment, pruning especially, with an eye to keeping the heads well open to light and air, the crops may be materially increased annually.

The year after planting they yield a good crop of large and showy fruit, fully equal in size and quality to the famed berries of England, for in fact only the best and finest varieties of the Lancashire Gooseberries are selected for grafting.

2. The perfect immunity from mildew when grafted on the stock employed by us for this purpose. These "Standards" have been perfectly free from mildew, while plants of the large English Gooseberries grown low as bushes in the same garden—in fact, on the same border—have been badly affected by it.

3. The extraordinary size and beauty of the fruit, and the excellent quality of the same.

4. The beauty and usefulness of the plants as ornaments for garden or lawn.

5. The absolute cleanliness of the fruit, it being grown so high above the ground and its immunity from sunscald when grown in this manner.

6. The perfect immunity of the stock used for grafting from the attacks of the borer.

The method of grafting high as a standard, say from 4 to 6 feet, does away with and entirely supersedes the old method of training up a shoot to the desired hight to form a small standard, and then, when you think you have succeeded at last, have all your labor and care lost through the ravages of the borer, as the latter attacks the current stem especially, and thus, of course, ruins the tree.

The stock employed for grafting is *Ribes aureum*, the Missouri Currant. The stocks are grown by stooling, and at two years' of age they are fit for grafting. They are removed from the stools, potted, or wrapped in balls of moss, fastened with wire, and kept in a cold-frame till about the holidays, when they are removed to a cool house, and then forced very gradually, being kept rather dark.

As soon as they start readily they are ready for grafting, and then are given full light and a little more heat.

At this time, and especially as the grafts start, a sprinkling with tepid water proves beneficial—in fact, it is necessary—but at no time should the plants be kept too moist.

The method of grafting employed is the American whip-graft, and for heavy stocks, the ordinary cleft-graft.

By pinching the stocks in season when they have acquired the necessary hight, we obtain branched heads, and so are enabled to set several grafts on one plant; for instance, both Currants and Gooseberries, or several varieties of either.

As soon as they have made a good growth, they are again removed to a cool house and gradually hardened off. By spring they are either plunged or planted in nursery rooms, being salable by the ensuing fall.

The ease with which the fruit can be picked and handled from these standards is a very great advantage, the disagreeable labor of picking the fruit from the low bushes having until now been a great drawback in the culture of the Gooseberry.

We have a border planted with these standards which at the same time does duty as a strawberry border with excellent results. So there is a chance of two crops at the same time.

They require good land, liberal manuring (top-dressing), and a cool or not too hot situation. Mulching would prove of great benefit.

We have grown and exhibited Gooseberries on these standards 3½ to 3¾ inches in circumference, weighing 1½ to 1¾ ounces each, not "strawberries," as grown in England, for the plants were liberally loaded with fruit.

The standard should, of course, be well staked and tied, the stakes reaching well up to the head, the ties to be strong and secure to prevent chafing.

The plants (standards, thirty in all) that we exhibited at the Centennial in the rear of Horticultural Hall, were planted on the 10th of April, grew well in every instance, and ripened fine crops of large and showy fruit, without receiving any special care whatever, as regards watering or mulching.

N. B.—The grafts are wrapped with waxed paper, which we prefer to any other material in this instance. Albert Kuhn.

Hoboken, N. J.

[An engraving of [the] Standard Gooseberry has already been published. The accompanying sketch of the Standard Currant appears for the first time.—Ed.]

The Wild and Cultivated Carrot.—Mr. H. Hoffman, a German experimenter, among trials to show the constancy of certain characteristics of plants found that the cultivated carrot and the wild form fully established their identity, which, however, few people, we imagine, would have disputed.

Sheep Husbandry.

NORTH CAROLINA NOTES.

In a country where more dogs than sheep are kept it seems presumptuous to attempt the breeding of the latter for profit, still I have a plan which I offer for the consideration of Southern farmers:

First. There can, as I believe, be no stock better adapted to the improvement of these lands; besides enriching the soil they prove themselves efficient aids in the subjugation of blackberry bushes and the many other troublesome plants which so soon take possession of the old fields when thrown out of cultivation, whether seeded to grass and clover or not, while at the same time they are paying their way in wool and lambs. The climate is such that very little feeding is required except when fattening for market in the winter. Also lambs dropped two months earlier than they usually are five hundred miles farther north, would be in condition for market correspondingly early when prices usually are better.

Within the circle of my limited acquaintance can be counted scores of farms on which from one to a dozen worthless cur-dogs are supported but not one sheep. Those few farmers who do keep sheep tell me the dogs seldom trouble them, and that the percentage of loss from that cause is very light. No doubt if there were more sheep, the less would be heavier. As a remedy for this difficulty the sheep should be enclosed at night inside a dog-proof fence, which may be made of posts and boards 4½ or 5 feet high letting the posts project 4 inches above the boarding. Spike to top of each post, at an angle of 45 degrees, a piece of 2 by 4 scantling about 2½ feet long, extending outward. Board these up the same as the posts, then with a lock on the gate it would be thief-proof too. Could such a fence be made portable the additional advantage of enriching several plots of ground in one season would be gained. Will you or some of your readers suggest something better?

Nearly all the sheep that I have seen here are such as were found in all parts of the country thirty years ago, coarse, light wool, none on the face or legs and very little on the belly, long-legged and good jumpers. Now I would like the opinions of some of your old and experienced breeders as to the policy of breeding ewes of the progeny of this description to pure breed Merino rams until the flock is bred up to a grade of say three-fourths Merino, thereby getting a good carcass, strong constitution and more and better wool; then, providing the demand for mutton and long wool continues as it has been for a few years past, discard the Merino rams and use Cotswolds or Shropshires.

Snow fell here all Thanksgiving day but melted so fast that it only accumulated about two inches. Since then until to-day, (Dec. 7), we have had what is considered very cold weather here, the thermometer indicating 19° above Zero on the morning of the second, which is said by old residents, not to have occurred so early in the season before in fifteen years. M. B. Prince.

Ridgeway, N. C.

Floricultural.

MINUTE HOT-HOUSE DIRECTIONS.

GATHERED FROM CURRENT BUNSBY FLORICULTURAL LITERATURE AND INTERPRETED

BY AN OLD GARDENER.

Plants love sunshine. The reason why they love sunshine is because it sharpens up their appetites and at the same time provides them with their dinners. This is a selfish sort of love on the part of plants—but sunshine is benevolent and knows full well that plants could not get on without its aid; that the carbonic acid which they imbibe would destroy them if its oxygen were not released; that their leaves would be white; that they could produce no progeny and would soon become extinct. And so sunshine, knowing the helplessness of plants, smiles upon them without inquiring whether they appreciate it or not. Plants ought to be grateful, certainly. But very little is known as to their sense of moral obligations.

Plants should have plenty of sunshine, and they need it most when the days are dark and gloomy.

Give your cats plenty of milk, that they may not enter the conservatory in pursuit of water or food and upset the plants. The same may be said of other animals—varying the food to suit their tastes—such as mice, rats, insects.

Flowering is a highly exhaustive process. At this most trying period of their existence plants need *stimulants*—the only period, indeed, when they fall into the jolly habits of many men, some women, and a few boys, and cannot control their appetites. *Pelargoniums, Epiphyllums, Aphelandras, Cinerarias, Echeverias*, etc., etc., will be coming into bloom sooner or later. Less patience is, therefore, required in the former than in the latter case.

When you have visitors, always take for granted that they are as much interested in the subject as you are and talk about nothing else but flowers. Show all you have—not in a hurried manner, but deliberately—and tell their histories and give their Latin names. In this way you may acquire a flow of floral language and your visitors may be taught the virtue of patience.

As a tea-kettle will not boil, so flowers will not bloom so soon if watched. While this singular phenomenon has never (I believe) been explained in the instance of the tea-kettle, in the instance of flowers it has been shown that—but I am at this moment reminded that I must not anticipate an exhaustive work upon this subject by Mr. Charles Darwin or Mr. Thomas Meehan (I have the names so mixed up in my mind that I cannot for the life of me tell which) that in point of infinitesimal research will quite eclipse anything previously recorded by those or other microscopical observers.

The quantity of water needed by different plants and the times of watering depend upon many intricate phenomena which cannot be here noticed. It is easier to determine this in plants with normal appetites and in vigorous health than in those which have led a pampered, intemperate, abnormal existence. An exact knowledge of the laws of introsusception, immiscibility, phytotomy and morphology is indispensable in either case. Floricultural books and periodicals tell us that when very dry they need more water than when very wet, and that when very wet they do not need to be watered. This may be true enough in general practice, but no fixed rules can be written suited to individuals, and people *must* be guided by the most observant experience and inveterate study.

When leaves fall off—*something* is wrong. The first thing to be done is to find out what it is that is wrong and then remedy it.

When the pot is too small for the plant, or, what is nearly the same thing, when the plant is too big for the pot—it may be placed in a size larger. Then it will not feel so much cramped as before. It is thought that plants—like men of business—do not like to be cramped. The great difference is that men cannot always find somebody to supply a pot "one size larger."

Look out for red spider. A way to keep them within bounds is to go over the plants every day with a microscope and kill, with the thumb and finger, every one you see. This, of course, will require time. It will require more or less time as the collection is small or great. If the collection consist of but one plant, it will take one hundred times less time than if the collection consist of one hundred plants.

Various remedies for aphides, mealy-bug, etc., are proposed by experts. I have noticed alcohol, turpentine, carbolic acid, sulphur, hellebore, nitric acid, sulphuric acid, tobacco, salt, and two hundred others. I have not tried them all, and cannot speak from experience. I should think, however, that if all of them were "judiciously" mixed together in a reservoir and the plants submerged therein that an effect would be produced upon them which would guide the operator advantageously in his future experiments.

It may puzzle the reader who has a considerable collection of plants to minutely attend to the above and to many other essential operations which the floricultural journals weekly record, requiring, as such attention would, more time in every day than there is in the day. This has always puzzled me.

MISCELLANEA.

Zebra striped Eulalia.—The American Agriculturist gives a fine cut of *Eulalia Japonica Zebrina*, a beautiful, transversely-striped Grass sent to this country by Mr. Thomas Hogg from Japan.

That variegation should be deemed a disease at all is, we believe, one of those vagaries that sometimes creep into the heads of scientific men. As "the circulation of the juices of the leaf must take place in a lengthwise direction," the A. A. reasons that this plant, whose variegation is transverse, must present a puzzling problem to those who believe in the disease theory, "since the nutriment for each green portion of the leaf must pass through one of the colored sections."

The Pelargonium Happy Thought should prove no less puzzling. This plant is as vigorous as any other Pelargonium. Cuttings from it strike as easily as those of any other—and yet the disc is a creamy-white, and the veins which carry nutriment to the green margin must, of course, traverse it afterward.

When nothing whatever is known respecting the cause of certain phenomena, why not say so? But it seems that one theory, however absurd, is good until another is advanced, and that the rule is—a silly theory is better than none. If we look back upon the egregious blunders that have been made from building superstructures upon imaginary foundations, it would seem that *no* theory is far better than a senseless one, and that scientific men cannot afford to be scientifically ingenious at the expense of common sense.

If it is true, alas! that variegation in plants is a disease, what should disturb us most is that the present rage for variegated plants and consequent propagation of them, to the neglect of the healthy, unvariegated sorts, can be considered in no other light than a cruelty to vegetables; and that the lovers of flowers, whose sensibilities are supposed to have been softened and refined by this fondness, have encouraged the increase and spread of this "malady," and that societies for its prevention have not sprung up everywhere, are sad evidences of the general depravity of man and womankind.

EXTRACTS FROM CORRESPONDENTS' LETTERS.

The Rural's Exchange.—I wish to express my thanks to the Rural for its liberal offer of Oct. 7. I received nine letters containing a *great* many seeds, and they were all *nice* varieties.

Many in their letters expressed their gratitude to the Rural for opening a way for us flower-lovers to become acquainted. I wish I had something rare to send you.

I intend to plant Rose and Dahlia seeds in the spring.

I have watched everything in the Rural pertaining to plants or trees; seen the different letters telling about raising new varieties from seeds, and I will be glad to tell you if I succeed well.

I have raised several beautiful Pansies and Daisies from seed, and have found they grow much larger if the ground be kept loose and mellow and then watered often.—M. A. R., *Waitsburg, Walla Walla Co., W. T.*

Liquidambar for Rustic Work.—I have been wondering for some time why I have never seen any rustic work made of the branches of the Liquidambar, which grows so plentifully here. I now have some branches hanging on my walls that are quite ornamental as well as curious to those unaccustomed to seeing such every day.—M. B. P., *Ridgeway, N. C.*

Tritoma Uvaria.—I have one of these plants which was set out last spring and began to bloom in September. It is now (Dec. 5) in bloom, although we have had in this section quite cold and freezing weather for more than a week. The ice over the Potomac River was about three inches thick yesterday.—J. W. H., *Cumberland, Md.*

NOTES.

Color.—As illustrative of the widely different views held by individuals as to the shades of color, the Gardeners' Chronicle mentions an instance of a few common Dahlias having been shown to thirty-four different persons. Thirteen different names of supposed shades of color were given. One of the flowers, moreover, had been placed before a family and friends comprised of eleven people, and these, though related by blood, education, etc., were by no means unanimous, for in the written answers seven various names of the color were used. Some attribute such facts as due to color blindness; but the truth possibly lies in the fact that with most persons there is no very clear appreciation or standard of names and shades of color.

Anthuriums.—Few plants are more showy for conservatory decoration than these. *A. Scherzerianum* is one of the best. The spathe lasts for months. *A. S. Williamsi*, a novelty, forms with it a fine contrast. Its habit is the same, but the spathe is pure white and the spadix a pale lemon color.

Buttonhole Bouquets.—At a recent banquet of the Lord Mayor of London, one thousand of these were provided—one for each guest. Are we to suppose that the Lord Mayor of London "buttonholed" every one of his guests?

Golden Pyrethrum—Is it Poisonous?—A correspondent of the Gardeners' Chronicle of London mentions the fact that two bucks were found dead in a certain park and that a post-mortem examination gave proofs that they were killed by having eaten the Golden Feather Pyrethrum. Thus warned, we should beware of this favorite bedding plant.

Rose Elections.—Our readers may or may not be aware that Rose Elections are held in England for the purpose of ascertaining by the votes of experienced Rose growers those Roses which are held in highest esteem. We give the first twenty of the last election, the comparative merits of which are indicated by the numbers:

1 to 4, Marechal Niel, Alfred Colomb, Marie Baumann, Baronne de Rothschild; 5, Charles Lefebvre; 6, Etienne Levet; 7, La France; 8, Louis Van Houtte; 9, Marquis de Castellane; 10, Duke of Edinburgh; 11, Madame Victor Verdier; 12, Comtesse d'Oxford; 13, John Hopper; 14, Devoniensis; 15, Catherine Mermet; 16, Senateur Vaisse; 17, Xavier Olibo; 18, Francois Michelon; 19, Horace Vernet; 20, Mdlle. Eugenie Verdier.

Arboricultural.

THE CALIIFORNIA CHESTNUT.

We had often heard of the California chestnut, says the Sonoma Democrat, but did not believe in its existence. Traveling recently in northern Mendocino county, just after leaving Willetsville, our attention was attracted by a magnificent tree near the roadside, which we at once recognized as the chestnut, of which we had often heard but had never before seen on this coast. Fortunately, though we were not then aware of it, Dr. A. Kellogg, a botanist of San Francisco, was a fellow passenger. He had often visited that part of the State before, and was perfectly familiar with the tree and its habits. He kindly consented to give us a written description for publication, and it is with pleasure that we present to our readers the letter of the accomplished gentleman, on one of the most beautiful productions of our California forests:

Meeting as traveling companions on the stage route from Little Lake to Cahto, the writer was highly gratified to find a stranger so justly appreciative of the elegant beauty, symmetry and grandeur of our golden-leaf evergreen chestnut (formerly *Castanea chrysophylla*, now *Castanopsis chrysophylla*).

The title of golden-leafed chestnut—as the suggestive name implies—is derived from the observation that when stirred by the breeze, the otherwise dark, glossy-green, laurel-like leaves turn their under surface to the sun, reflecting a softened sheen of gold, lighting up its face with a cheerful smile against the somewhat somber background of green; also the young and tender twigs, with their vernal foliage clad in yellow velvet, hold the attention effectually and steadily to its true ideal characteristic feature. This latter quality, seen from a distance in the spring season of a year, awakens a charming illusion as if the beholder were viewing a magnificent evergreen tree clad in golden bloom. Another California forest tree—and we have many such—occurs to me as I write, showing this illusive feature, to the eye more ornamental than the never-changing foliage, shrubs and trees, the sickly work of men's hands; we allude to the dense-flowered chestnut-oak, tanbark oak of the forest vandals (*Quercus densiflorus*). In this oak, the young twiggy tufts are an almost pure velvety white against a lighter green background. This, like the other trees, is a very choice landscape ornament, simulating it in flower, foliage, and often in general symmetrical outline, though of somewhat more open and spreading habit. It is an evergreen, and claims close botanical alliance with the chestnut. The one bears a prickly chestnut burr with hard-shelled and sub-triangular sweet nuts; the other, or oak, has the mossy cup and large well-known acorn. But to return from this digression, which was deemed advisable by way of contrast, as so many are apt to confound the two trees, which leads to confusion, and may lead to controversy.

The huge dimensions of this tree struck you with some surprise. Trees, five to six feet in diameter, 40 to 80 clean trim bark, 100 to 150 feet high, and such a magnificent ornamental shade and shelter for certain fog-line localities of this State, and for foreign climate generally! Besides, for valuable timber, the wood splits traight and as readily as its Eastern cousin, is soft and is easy to work; but becomes very hard when dry from age. As seasoned stuff, it plains and polishes remarkably smooth, and is valuable when stained for the finest cabinet work; is very tough, and valuable to the wheelwright. Your expressed desire to aid in the diffusion of useful intelligence, even in the midst of an exciting political canvass, is itself prophetic of the "good time coming." If the attention of the public is often invited to these objects, we may reasonably hope during the next century that some progress in due appreciation may result. The popular press is the best of all educators, and the duty of the local representatives is best fulfilled by aiding and directing us in every way that develops our home resources, adds to the delight which all, more or less, experience in viewing forests and fields and all the more beautiful objects of the landscape.

It seemed needless to add, the nuts are among the articles used as food by the Indians of this coast. This tree, in some localities, dwindles down to a paltry bush, bearing fruit on its top when barely a foot high to as high as your head. It goes under the half-borrowed Southern Atlantic name, with the local prefix of California, chinquapin chestnut, which is said to be of the same species as the large tree you beheld.

THAT METHOD.

Our readers will remember our allusion to a remarkable method of propagating trees and shrubs which was by its simplicity to upset all other known processes. The gentleman Mr. Bachratz an Austrian nurseryman first offered his secret for a small sum and finally, we believe, communicated it gratis in an article to the Wiener Gartenfreund. The Gardener's Chronicle epitomizes it thus:

Cuttings of shrubs and trees are taken off at the beginning of July, from 6 or 7 to 12 inches long, according to the kind. The leaves are removed from the lower portion which is to enter the ground, but those which will come above-ground are attached. Beds are prepared for them in the open air by thorough digging and leveling, and afterwards applying a superficial layer, about 2 inches thick, of rotten dung from a spent hotbed. The cuttings are then stuck in about 2 inches apart and in a somewhat oblique direction. Each bed when filled is surrounded with a lath fence, so that shade may be given when the sun is very hot, and the cuttings are well watered in with a rose-spouted can. This completes the operation. The only further care necessary is a sprinkling overhead three or four times a day during the first week, if the weather be very hot, and once a day afterwards. In the course of five or six weeks, treated in the manner indicated, the cuttings of most things will have formed a callus, and further shading will be unnecessary.

Late in the autumn a layer of rough dung, 2 or 3 inches thick, is spread over for winter protection. It also serves as manure when the cuttings start growing in the spring; and cuttings treated thus make extraordinary growth—in fact, plants equal to two-year-old plants from winter or spring cuttings. Very few, it is asserted, fail. This plan would doubtless succeed very well in this country, and indeed it is practiced in the case of the common Laurel and some few other things. The new method of grafting Roses is the insertion of growing eyes early in spring, instead of dormant eyes in the summer. They are inserted in the main stem one on each side, to form symmetrical heads. These make, it is said, as much growth the first season as the dormant eyes the second season.

Around the Republic.

RIVERS AND DEEP CANYONS.

The wearing away of the earth by the action of streams is familiar to all, says the Pacific Rural Press; but the vastness of this influence in modifying the surface of the earth is rarely appreciated, except by the professed geologist. In passing across the continent, from the Atlantic to the Pacific, the regularly increased evidence of this action is noticeable at almost every stage of progress. It is not, however, until the traveler has passed the crest of the Rocky Mountains, that he beholds the most extraordinary phenomena of this description. Very deep canyons are comparatively rare east of those mountains, while they become the almost invariable rule to the west of them. Two

of the most remarkable instances of this character are, perhaps, the Black Rock canyon, on the route from the Great Bend of the Humboldt to Goose lake and Oregon, and the still more famous canyon of the Colorado. This latter is rightly considered the most remarkable depression, or rather excavation, of the kind in the world. It has never been properly understood or appreciated, until the appearance of Powell's report on the subject, published lately by the Government. The land of this region is an elevated plateau, and for many miles the Colorado flows through it, in a narrow channel, 6,000 feet below the plateau!

Throughout the entire western flank of the Sierra Nevada, the principal rivers, in the upper portion of their course, have generally cut their way down from 2,000 to 4,000 feet in depth, with banks upon either side rising at an angle of from 35 deg. to 45 deg. with the plane of the river. It has been supposed by many that these channels were formed before the rocks had become so much indurated as to prevent any very serious obstacle to their being worn away. But such could not have been the case, as we find that before the present river courses had an existence, there was another system of rivers, running at almost right angles with the present water courses. In excavating into the beds of these ancient rivers, as the miners are now doing in thousands of places, we find most unmistakable evidences that even they flowed over the country after the country had become fully as much indurated as it now is. The upper branches of the American River have, in some places, worn their way 3,000 feet below the beds of these ancient streams. In almost every part of our mountains this characteristic is manifest, even to the most casual observer, although it is difficult to imagine the forces and time required to have accomplished such results.

SOUTH FLORIDA.

Those of our readers who may contemplate visiting Florida the present winter will be interested in the following from the Tampa Guardian:

The prospect of South Florida's improvement is now more flattering than ever before, its rich resources being better understood by Northern people seeking homes in a congenial climate. They now begin to understand that the lower Gulf counties possess advantages vastly superior to their sister counties, by being in winter directly under the influence of the warm breezes from the Gulf Stream and protected from the cold winds from the North by the forests. Here in those counties are found the richest lands of the State, particularly adapted to the growth of tropical and semi-tropical fruits, corn, rice, sugar-cane, potatoes, ground peas, tapioca, vegetables of all kinds, and the finest staples of Sea Island cotton and silk. Large bodies of very rich lands may be had in any of the above counties, in lots of 160 acres, under the Homestead act. Thousands of persons will probably settle in the Gulf counties of South Florida this fall and winter.

Domestic Economy.

ALL ABOUT TAPIOCA.

What the Wheat plant is to the inhabitants of cold climates, the Cassava plant is to those of the Tropics. From the Cassava root is manufactured the Tapioca of commerce, and how it is done, and the great value of the plant is pleasantly told by H. F. A. Pinckney in a late number of the American Grocer, from which we condense the following:

The plant from which Tapioca is obtained is a native of South America, and is cultivated extensively in Brazil, as also in many parts of the East Indies and the Indian Archipelago. It is a woody plant, with slender stalks, and grows to the hight of about eight feet, and is known as the Cassava or Mandioc plant. It has smooth, palm-shaped leaves, and bears small, green flowers, which grow in clusters, with an immense sized, fleshy root, sometimes weighing as much as 40 or 50 pounds. The plant belongs to a highly poisonous tribe, and is itself one of the most virulent of the species. This poison is found more particularly in the juice of the plant, a small quantity killing birds, quadrupeds, and even man himself, causing cold perspirations, great swelling and convulsions, generally ending in death; but this deleterious substance is so highly volatile if exposed to heat, or even the open air for about two days, that its property is entirely dissipated.

The root from which Tapioca is procured is of rapid growth and comes to perfection in six months, and somewhat resembles a huge parsnip. It is then taken up and washed, and the rind, which is of a dark color, peeled off; then grated or ground into a pulp, and the pulp submitted to pressure, by which the juice is expressed and preserved. The meat or pulp that remains in the press, being dried, is called conaque, and is made into bread or cake, which is called cassava bread. The expressed juice, being allowed to stand, deposits a white powder, which, after being well washed and dried, constitutes what is called Tapioca flour or Brazilian arrowroot, and by the French, moussache. All the products of the root are nutritious and easy of digestion. The natives frequently ferment the expressed juice with molasses and form an intoxicating beverage called onycan, that supplies the place of wine and beer of the the temperate climate.

There are nine different species enumerated by botanists, but two only of which are cultivated for human food; they are known as the bitter cassava and the sweet cassava. The two roots are very similar, the first by far the most poisonous, the only perceptible difference between the roots being a tough ligneous cord running through the center of the sweet cassava root, which the bitter variety is wholly without.

Bread is made of both kinds, which is palatable and wholesome. In Guiana the mode of preparation is as follows:—The root is rasped in large tins or wooden graters fixed on benches, behind which the women employed in making it stand in rows. A sufficient quantity being rasped for one time (for the surplus would ferment and spoil), it is put in long, circular baskets of plaited rushes, about ten feet long and ten inches in diameter, called manigueras. These are hung up with weights attached, which draw the plaited work together, thus squeezing out the juice. When all the fluid is extracted, the manigueras are emptied of their contents on raw hides laid out in the sun, where the coarse flour soon dries. It is then baked on smooth plates, made of dry clay, with a slow fire beneath. This is the most difficult part of the process. The coarse flour is laid perfectly dry on the hot plates, when the women, with a dexterity only to be acquired by practice, spread it out in a round and very thin layer, nearly the size of the plate it is laid on. This they do merely with a piece of calabash, which they keep in constant motion, pressing gently every part of the surface until the heat has united the meal into a cake, without in the least altering the color or scorching it. Their method of turning a cassava cake of that size is like sleight-of-hand, for they effect it with two pieces of split cane without breaking it, though scarcely as thick as a dollar, and as yet only half cemented together and of a substance always brittle, especially when warmed.

This cake is very nourishing and will melt to a jelly in a liquid. After becoming cold it is broken up and is the Tapioca of commerce, but it is dangerous if eaten in any large quantity when dry, as it swells, on being moistened, to many times its original bulk. It will keep good for any length of time if kept in a dry place. The Eastern Tapioca is generally packed in bags of 100 pounds each, but that of South America, and commercially known as Rio Tapioca, is generally packed in barrels of about 200 pounds weight, and is considered far superior in quality; consequently it commands a much higher price.

YELLOW-COVERED CINCINNATI HAMS.

Prof. Bouchardat, one of the members of the Parisian Council of Hygiene, has recently called public attention to some of the foreign preserved meats imported into France as being unfit for human food, and in many cases positively dangerous. He refers especially to a kind of ham imported from Cincinnati, which is usually enveloped in a cloth saturated with a yellow substance, which, on examination, proved to be chromate of lead—a ready poison. The Professor suggests that if the American purveyors prefer to have a yellow envelope around the alimentary substances they export, the chromate of lead may be replaced by any other yellow substance — turmeric, for instance, which is known to be entirely harmless.

A Recipe for Marble Cake Wanted.—Will some reader of your most valuable paper please give through its columns the best recipe for marble cake and greatly oblige a constant reader? —Estelle.

SELECTED RECIPES.

Plain Plum Pudding.—One pound of chopped raisins; one cup of suet, or butter; one cup of milk; one cup of molasses; four cups of flour; one-half teaspoon of soda. Mix well and boil four or five hours.

A Christmas Plum Pudding. — Take one pound and a half of raisins, the same quantity of currants, the same of grated bread rubbed fine through a colander; one pound of chopped suet, half a pound of citron, one lemon chopped fine, one grated nutmeg, one teaspoonful of ground cinnamon, half a pound of brown sugar, one teacupful of flour, six eggs well beaten, a glass or two of brandy, a little salt, and as much milk as will make it the proper consistency. Put the mixture into a buttered mold and tie over with a cloth. Boil four or five hours. Send to the table with brandy sauce. The water must boil before the pudding is put in, and should be kept boiling all the time, or the pudding will not be light.

Cottage Christmas Pudding.—A pound and a quarter of flour, fourteen ounces of suet, a pound and a quarter of stoned raisins, four ounces of currants, five ounces of sugar, a quarter of a pound of potatoes smoothly mashed, half a nutmeg, a quarter teaspoonful of ginger, the same of salt and of ground cloves. Mix those ingredients thoroughly, add four well-beaten eggs, with a quarter pint of milk; tie the mixture in a well-floured cloth and boil it four hours. Serve with brandy sauce.

Orange Snow-Balls.—Wash well half a pound of rice; put it into plenty of water; boil it quickly for ten minutes; drain and let it cool. Pare four large oranges and clear from them entirely the thick white inner skin; spread the rice, in as many equal portions as there are oranges, upon some pudding cloths; inclose an orange in each, tie up, and boil the snow-balls for an hour; turn them carefully on to a dish, and strew plenty of sifted sugar over them.

Apple Snow-Balls.—Pare and core some nice, tart apples, without dividing them. Prepare the rice as in the foregoing recipe, inclose the apples in the rice, and boil them for an hour. Serve with butter and sugar stirred to a cream, with any flavoring agreeable.

To Boil Pigs' Feet to Fry.—Scrape, singe and wash the feet through several waters. Put them on to boil, with two or three tablespoonfuls of salt, according to the number of feet. When very tender, take them out of the water, place them on a dish, draw out all of the large bones, and then let them cool. Season them with salt and pepper, roll them in corn meal, and fry a nice brown. When about half fried, add a little vinegar; when done, place them on a dish, pour the gravy over, and send them to the table very hot.

Soused Pigs' Feet.—Clean thoroughly, put them into hot, salted water, sufficient to cover them, and let them boil slowly until perfectly tender. When done and cool, cut the feet apart, remove the large bones, put them into stone or glass jars, and cover with good cider vinegar, to which add a few cloves, two or three dozen grains of allspice, and two small red peppers, cut fine.

Roast Partridge.—Dress and singe them; fill the bodies with a stuffing of bread crumbs, seasoned only with pepper, salt and butter; put some cold stock or gravy into the pan and baste frequently; three-quarters of an hour will cook them. Serve with gravy, enriched with some good, game sauce, with mashed potatoes and jelly.

Partridge Salad.—Place the remains of roast partridge in a deep dish, with oil, vinegar, shallot minced, salt and pepper. At the time of serving, place the partridge in a dish, surround it with the hearts of lettuce cut in quarters (if these are not obtainable, use celery); garnish the partridge with hard-boiled eggs, cut in quarters, minced cucumber pickles, pickled onions, and pickled olives, and stir them in thoroughly with the mixture remaining in the deep dish.

Hygienic Information.

THE BEARD—TO SHAVE OR NOT TO SHAVE.

Men may laugh and sneer at the follies of female fashions in dress, their chignons and bustles, their rats and panniers, and deplore the injury they receive from their corsets and high-heeled shoes, but the sneers come with an ill grace from those men who try with the razor to make a female face of their own. The time has been when both sexes looked upon a full flowing beard as ridiculous and ugly if not sinful, and a minister has been censured for his foppishness in leaving his whiskers to grow for an inch below the hair of his head, and a man has reproved, in all honesty, his brother church member, for letting his beard got over a week old, without even admitting his excuse that his razor was dull and he had no hone to sharpen it with. I have even heard the questions debated by old codgers whether or no the beard was one of the curses bestowed upon man for his sin in eating the forbidden fruit. But the times have changed, people think more, and reason from a more rational basis, and a full beard has become as respectable as ornamental; a glory to man as much as long hair to a woman, as is said by Paul to the Corinthians. The tables are now turned, and the fops are those that shave. Not so much those who make a clean business of it, as those who shave a part; the most sedate of whom shave only the upper lip, the next in the order of propriety shaving only the chin, leaving the extreme of foppishness to those who shave *all but the upper lip.*

The changes which time works in popular opinion are wonderful and often ludicrous. A gray-headed smooth-faced deacon, some twenty years since, while whiling away an hour with his grocer who wore the beard on his throat as "a covering," expressed his respect of the grocer's general morality, but reproved him severely for the "fo-o-o-olish fashion" of letting the hair grow on his face. Grocer replied, "man was made with a beard on his face." "How do you know?" says deacon (thinking evidently of the profanity in denying it to be one of the "cusses.") "I know," replied Grocer, "because I find it on him, and I believe it to be given to him by his Maker for a wise purpose, and the foolish fashion you speak of is in shaving it off, and thus trying to thwart the designs of your Maker." This theology was too deep for the deacon.

A man expressed to his wife a profound respect for her married sister; the wife replied "she thinks much of you but she cannot tolerate your whiskers." "Oh," says he, "she will get over that, they are becoming fashionable." "Not she" was the reply, "she cares little for fashion but a great deal for propriety." Twenty years afterwards this lady saw this sister trimming, brushing, and admiring her husband's long white flowing beard.

The word barber comes from barb, which is synonymous with beard, and a historian says that the word barbarous, was originally applied to those savage nations who cut off the beards, to prevent it from being a handle for their enemies in a hand-to-hand fight; just like soaping a fighting dog to give him an advantage over his adversary.

Who that has worn his beard for a few years like *a man*, and given his razor to his wife to pare her corns with, used up his soap on his hands, and put his brush to a new use, could be induced to resume the legitimate use of the razor, and thus endanger his health, waste hours per week wickedly, pay a weekly salary to his barber, wear patches on his face to staunch the blood, and appear before the world with a mutilated countenance? S. B. Peck.

HOW TO TREAT INSECT STINGS.

A writer in the London Garden gives the following hints on this subject:

The pain caused by the sting of a plant or insect is the result of a certain amount of acid poison injected into the blood. The first thing to be done is to press the tube of a small key firmly on the wound, moving the key from side to side to facilitate the expulsion of the sting and its accompanying poison. The sting, if left in the wound, should be carefully extracted, otherwise it will greatly increase the local irritation. The poison of stings being acid, common sense points to the alkalies as the proper means of cure. Among the most easily procured remedies may be mentioned soft soap, liquor of ammonia (spirits of hartshorn), smelling salts, washing soda, quicklime made into a paste with water, lime-water, the juice of an onion, tobacco-juice, chewed tobacco, bruised dock leaves, tomato juice, wood-ashes, tobacco ash, and carbonate of soda.

If the sting be severe, rest and coolness should be added to the other remedies, more especially in the case of nervous subjects. Nothing is so apt to make the poison active as heat, and nothing favors its activity less than cold. Let the body be kept cool and at rest, and the activity of the poison will be reduced to a minimum. Any active exertion whereby the circulation is quickened will increase both pain and swelling. If the swelling be severe, the part may be rubbed with sweet oil, or a drop or two of laudanum. Stings in the eye, ear, mouth, or throat sometimes lead to serious consequences; in such cases medical advice should always be sought as soon as possible.

Inventiveness of Homicides. — The truth that private enterprise is more productive than any government ingenuity can be, is happily illustrated by the information, for which we are indebted to a French writer, M. Camille Debans, that while individuals have discovered one hundred and seventy-four different ways of committing murder (exclusive of the regular medical practice), the governments of the world, civilized and uncivilized, have hit upon no more than fifty-four different ways of inflicting the death penalty.

Ventilation.—Some people object to breathing the air of their bed-rooms over and over from fall till spring, and very often the moisture will run down the windows and freeze them fast so that they cannot be raised for fresh air. A small handful of salt put along the casing on which the window rests will keep it always thawed ready to be raised when required.—Farmer's Wife.

CHRISTMAS.

THE domestic character of our Christmas festivities seem most appropriate. It is the one day set apart by Christians in all lands as a homage to the paternal rule of the Creator, but it is among Protestants, we believe, that the day retains most of the sacred traditions that endears it to the heart of childhood. Happily, its influence embraces not only believers, but the strangers within our gates, who may consistently celebrate the birth of ONE whose life, apart from its religious teachings, is an example of purity and faultlessness without a peer. To such an example do we owe the idea of the Christian home, with its delightful traditions and virtuous influences; and it seems most natural that the family should cluster about the hearthstone, making of the day a quasi-domestic festival; observing its time-honored rites with a joyous gratitude for the love or blessings that have been vouchsafed from Heaven.

However much the conscientious and reflecting may soberly dwell on the importance of the day, and the marvelous effect wrought on the world by the life or example of Christ, it will be conceded that the prevailing idea concerning Christmas is a halcyon day for the children. What pleasure has gone to the filling of the stockings; what secrecy, whisperings, sly calculation, hidden purchases; what early rising and shivering in the cold to do the secretive work; what smiles from the young at the thought of the pleasure to be conferred by their loving hands! How graciously age looks back to its time of joy, reminiscence receiving a halo of sanctified remembrance when joining in the gambols of youth! The grandfather capers nimbly with his young friends, while his worthy companion furtively chases a tear at thought of the faded lang syne, when they too, looked expectantly to the Christmas tree for its pleasant surprises, and into each other's eyes for the confirmation of a mutual gift, that love which has since blessed and gilded their declining years!

It is no drawback to reflect that we are not positively certain about the true date of CHRIST'S birth, and we owe it to St. CYRIL that there lived in the fourth century a man with sufficient force of character to set the matter at rest by giving an authoritative date, based on the tablets of the Censors found in the Roman archives. It is a curious and pertinent coincidence, that our festival holds a close analogy to the pagan rites in honor of Saturn. Some say our customs are copied from that source. The Saturnalia are attributed to SEMPRONIUS, and originally consumed one day, but were extended to seven when CALIGULA flourished. Presents were exchanged, a "lord of misrule" under another name reversed the usual order of things, and altogether, the resemblance is most curious, extending even to the date, December nineteenth.

We learn from Mythology that the Delphic oracle became dumb; and when AUGUSTUS inquired the reason, was told that the oracle had announced the birth of a Child in Judea who was the Supreme God, who had commanded him to depart and return no more. Since that day the noisome vapor of superstition has been silently dissipated by the genial, and penetrating rays of the Sun of Christianity; and although at times our faith seems befogged by returning skepticism, it is but a momentary doubt, through which eventually appears, more clearly than ever, the rays of that true belief so tenderly reflected from the star of promise that, in the East, led the Magi to witness an event which was to be the salvation of mankind. The remembrance of which adds fervor to the wish that the RURAL'S readers may have a *very* Merry Christmas!

IT IS BETTER ALL AROUND.

IT is an axiomatic saying that "Honesty is the best policy;" and while there may be an occasional exception, as to all other good rules, we are inclined to think that, upon the whole, it would be better in the end if all men conducted their business on strictly fair and honest principles. We have been reminded of this thousands of times, but never had it more forcibly brought to mind than in our walks through the streets and markets of New York this fall and winter. It is strange that men who put up hay in bales to send to market, will so demean themselves as to stuff the center with poor, worthless weeds and damaged hay, while the outside looks bright and green; and yet it is done constantly and in thousands of instances which come to light every day, and the fraud is frequently detected in time to make the perpetrators suffer. One of the most flagrant but senseless attempts at cheating in baling hay we ever saw, came under our notice a few days since in a large lot sent to a commission house in this city. The hay was packed in layers, as usual with a certain well known press now extensively used, but in making up the bales two qualities of hay were put in, one layer being very superior and the next very inferior—in fact, almost worthless except, perhaps, for litter. When the bales were placed out in the light, the difference in the color of the hay in the layers was so conspicuous that it reminded one of a rag carpet composed of green and brown stripes. It is quite likely that the author of this fraud disposed of some of the hay at a good price; but the greater part had to be sold at the value of the poorest quality in the bale.

It is attempted cheats like those already named which depress prices of even a first-rate article in market. Topped-out apples with windfalls in the center and barrels of potatoes rigged out in a similar manner, are not just the thing to give purchasers sufficient confidence to order so freely as they would if there was a certainty of not being swindled. The same truth holds good with all kinds of country produce. The mother who has to depend upon the milkman for milk to give her children and supply both kitchen and table, will use this article far more freely if she can be assured that it is pure and wholesome, than she would where there is even a bare possibility of adulteration, thereby helping to increase the demand which generally ends in an enhanced price.

Of course we do not suppose that there is any more cheating among those who supply our markets with the products of their farms than in the manufacture of articles which the farmer obtains from the cities; but "two wrongs do not make a right," hence neither party can offer any justifiable excuse for cheating, and it would be much better all round if every man were compelled by law (if he will not do it otherwise) to make no concealment which shall work to the injury of those with whom he deals. What are termed the secrets of trade (if legitimate) and skill in manufacture or production, may all be employed to their utmost extent and still work no injury to any one.

SECRETARY OF AGRICULTURE.

THERE is a movement on foot to establish a Bureau of Agriculture as a Government Department, represented by an officer with the title of Secretary of Agriculture, who shall be admitted into the Cabinet on an equality with the Secretary of State, War, Interior, &c., thereby having a voice in the management of national affairs in general. This is certainly a move in the right direction, and it should receive the cordial support of every one having the least regard for the future of American agriculture. Now let the farmers "move on" Congress for such a recognition in the affairs of the Government, and see how much the politicians they have been honoring with an office and a good salary care for them, after once the election is over.

Several hundred thousands of the residents in the Western States begged of Congress last year, through their Representatives, a few thousand dollars to pay a competent committee for investigating the grasshopper question and to endeavor to discover some way of preventing the loss of millions of dollars' worth of property through the ravages of these insects; but what did they get in answer to their prayers for relief? Why, simply nothing but insults for their temerity in asking for what rightfully belongs to them. Go on, gentlemen of the leading Agricultural Societies, let your strength be felt; for if, by any known fair means, those holding the reins of this Government can be made to know that there is an agricultural class and feel their power, you will have accomplished something for which toiling millions will be thankful. Politicians and the political papers will oppose any such movement; but if our six millions of farmers and their representative, the Agricultural Press, make the proposed Department or Bureau of Agriculture a common cause, success is certain.

RURAL NOTES.

The Government Seed Store.—The Annual Report of the Commissioner of Agriculture shows that there have been distributed during the past year, 1,520,000 packages of seeds from the Department and, we may add, at a cost to the Government of a good many thousands of dollars more than they are worth to those receiving them. Of course, this seed business of the Department has furnished employment to many persons; but how much better for the country it would be if the rates of postage on seeds were put back to the old one of a half cent per ounce, the Government seed store abolished, and the money appropriated to its support handed over to the Post-Office Department, to make up any deficiency which might follow in giving us cheap postage on seeds. Men who have sense enough to cultivate plants, seldom have occasion to ask the Department of Agriculture to make selections for them. The free distribution of seeds by the Government has done and is doing more harm than good, besides costing the country hundreds of thousands of dollars.

N. Y. Dairymen.—Again we are called upon to record the proceedings of one of the best Associations of Dairymen in this country. At Elmira, N. Y., the Dairymen of this State assembled on the 13th and 14th inst. and listened to numerous scientific and practical addresses and thereby received much instruction upon a subject which so nearly concerns their welfare. These gatherings cannot be too highly commended. The discussions upon Dairy subjects containing, as they do, so much that is practical and useful, are themselves well worth a long journey and a few days' time, to say nothing of the valuable papers which are always to be heard on such an occasion.

Christmas Trees.—It would be interesting to know just how many families to which the RURAL NEW-YORKER makes its weekly visits have taken the advice given in its columns years ago to plant evergreen trees about the house, and are now able to cut out spare specimens for Christmas trees. We know that a goodly number of our readers can do this without loss to the good appearance of their surroundings, and many more might be doing the same, had they not neglected to plant evergreens in years past.

Frosts in Florida.—The Florida papers report a hard frost during the first three days of December; ice formed on water, oranges on the trees were frozen, and also the leaves and young twigs. Such checks will very much injure the reputation of some parts of the State for the cultivation of tropical plants and especially oranges and lemons.

RURAL BREVITIES.

PLANTING Black Walnut forests is an excellent way to lay up wealth for one's children.

THE Western New York Horticultural Society hold their next annual meeting in Rochester Wednesday, Jan. 24, 1877.

ICE containing impurities is just as unhealthy as the water from which it was formed, as mere freezing is not, in any sense, a purifying process.

ARTIFICIAL pearls are manufactured in Paris from the white scales of fish. Twenty thousand pounds of fish will yield one pound of the pearl substance.

BANKRUPTS in Scotland who conceal property from their creditors, are sentenced to penal servitude. If such laws were enforced in this country, there are some towns we could name that would soon be depopulated.

VERY cold weather reported by one of our correspondents at Griffin, Ga., Dec. 5. Mercury only 16° above zero, which is an unusual degree of cold for the time of year.

OUT of the 1,112 bankrupts reported last year in Massachusetts, only fourteen were farmers, and in New York State only forty-six in a total of 2,550 were farmers, which is a pretty good showing for a business which many persons declare is "played out."

WHAT nine out of every ten of the poor men out of employ this winter in all of our larger cities need, is the kind of religion which will always make them get up and build a fire for their wives on cold mornings and stay at home evenings to amuse the children.

W. J. ABERNETHY has retired from the editorial chair of the Farmer's Union, and HENDRYX & NEWTON become proprietors and assume general management. The Union has always been a good paper and we wish it continued success and a large patronage.

THE MESQUIT, a small tree found abundantly in some parts of Texas and westward to California, is said to yield a gum resembling Gum Arabic and quite as valuable; and it is also reported that considerable quantities have been gathered and exported during the past season.

POLLED CATTLE are becoming quite the rage in Scotland and are rapidly taking the place of the Short-Horns. But we are not informed whether this movement is the result of keeping Short-Horns or because Scotchmen have concluded not to take any kind of "a horn" in the future.

PROF. G. E. MORROW, who has for some time past occupied the chair of Agriculture in the college of Ames, Iowa, has accepted a like position in the Faculty of the Illinois Industrial University at Champaign. What Iowa loses in this change Illinois gains, and if the entire faculty were of such stuff as Prof. MORROW is made of, the said University would be much improved.

THE purchasers of butter in our markets have had good cause for complaint in the frauds perpetrated in adulterating the article with tallow and fat of various kinds; but our English cousins are said to have found a new source for supplying themselves with an oleaginous compound from which a kind of butter is made in the mud of the Thames River. Soap fat discharged by the sewers is collected and used in adulterating butter.

THE Rev. JOSEPH COOK, in one of his late lectures in Tremont Temple, Boston, remarked while illustrating a point in his discourse, that "Your beautiful tropical butterfly was once a repulsive chrysalis; it had only the power of crawling." Prof. PACKARD, or some other New England Entomologist, should inform the reverend gentleman that chrysalids of butterflies do not *crawl*, but the larvæ or caterpillars do. If Mr. COOK will study the "lilies of the fields" or even a milkweed in summer, he may learn something more than he now seems to know about "chrysalis."

CHRISTMAS.

HERE comes old Father Christmas,
With sound of fife and drums;
With mistletoe about his brows,
So merrily he comes!

His arms are full of all good cheer,
His face with laughter glows,
He shines like any household fire
Amid the cruel snows.
He is the old folks' Christmas;
He warms their hearts like wine,
He thaws their winter into spring,
And makes their faces shine.
Hurrah for Father Christmas!
Ring all the merry bells!
And bring the grandsires all around
To hear the tale he tells.

Here comes the Christmas Angel,
So gentle and so calm;
As softly as the falling flakes,
He comes with flute and psalm.
All in a cloud of glory,
As once upon the plain
To shepherd boys in Jewry,
He brings goods news again.
He is the young folks' Christmas;
He makes their eyes grow bright
With words of hope and tender thought,
And visions of delight.
Hail to the Christmas Angel!
All peace on earth he brings;
He gathers all the youths and maids
Beneath his shining wings.

Here comes the little Christ-child,
All innocence and joy,
And bearing gifts in either hand
For every girl and boy.
He tells the tender story
About the Holy Maid,
And Jesus in the manger
Before the oxen laid.
Like any little winter bird
He sings his sweetest song,
Till all the cherubs in the sky
To hear his carol throng.
He is the children's Christmas;
They come, without a call,
To gather round the gracious Child,
Who bringeth joy to all.

But who shall bring their Christmas,
Who wrestle still with life?
Not grandsires, youths, nor little folks,
But they who wage the strife:
The fathers and the mothers
Who fight for home and bread,
Who watch and ward the living,
And bury all the dead.
Ah! by their side at Christmas-tide
The Lord of Christmas stands;
He smooths the furrows from their brows
With strong and tender hands.
"I take my Christmas gift," he saith,
"From thee, tired soul, and he
Who giveth to my little ones
Gives also unto me!"

[Rose Terry Cooke.

FASHION NOTES.

NEW YORK, Dec. 16, 1876.

FURS.

A FEW words concerning furs may not be amiss. Seal-skin retains its favor, though the sacques worn this season are deeper than those of last. Bordering-furs are unplucked and plucked otter, beaver, black marten, genet, fisher-tail and chinchilla. Muffs are round and about the same size as those worn last season.

Shetland seal sacques range in price, according to quality, at from $75 to $300, untrimmed; when trimmed with sea-otter they command from $400 to $450; when trimmed with unplucked otter the price ranges generally from $150 up to $375; when bordered with plucked otter, $150 to $275; with chinchilla bordering, $150 to $300; with beaver bordering, $125 to $250, according to quality; and with bordering of black marten, $100 to $175—it being understood that upon the finer qualities of the seal skin the finer borderings are generally placed. Alaska seal sacques sell at $50 to $200, according to quality, and at an additional price if bordered with any other fur. Shetland seal-muffs and boas sell at $40 to $75 the set, and Alaska muffs and boas at $12 to $40 the set.

It is not generally known that Alaska seal-skin is preferable to medium quality Shetland. Seal-skin gloves will be in great favor for sleighing with both ladies and gentlemen. They range in price from about $4 to $12 per pair; gauntlets ranging at from $8 to about $16, according to the quality of the fur.

As usual among the staple furs, the Russian sable is of most importance. Its value, elegance and usefulness must render it always fashionable, though it may be comparatively little worn, because of the few skins permitted to be exported from Russia and their expensiveness. A set consists of the muff and boa. For sets of the best qualities of the fine Russian "crown sable," the range of price continues to be from about $1,000 to $1,600. Russian sables of a less costly grade range in price from $800 to about $1,000 per set.

American, or Hudson's Bay sable, ranges in price from $60 to $300 for sets of muff and boa. This fur is almost as handsome as the Russian to casual observation.

A new favorite fur, fisher-tail, fetches $75 to $150 per set, while *fisher-skin* ranges from $30 upward. This fur is durable and useful.

Mink, though not especially fashionable, is commendable for its utility; sets of round muff and flat boa can be bought for $16 to $80.

Alaska sable sets of muff and round boa range in price from about $20 upward. This is also a favorite trimming fur.

Among fancy furs may be classed chinchilla; sets are quoted at $40 to $95, and it is very stylish for trimming also.

The silver fox is still the favorite of the fancy furs with many ladies of fine taste and remains very fashionable, both in sets of muff and boa, and for trimming. Sets of muff and boa, according to quality, range in price at about $80 to $200.

Among the specialties of the season, fur-lined wraps are perhaps the most conspicuous. Beside the circulars, which have reappeared in Antwerp silk, plain and brocaded silk Sicilienne, *drap d'ete*, etc., there are paletots; of deep, plain, half-fitting coats, Dolman mantles, with both the shawl-shaped and the square Hungarian sleeves; round sacques and a modified wrap, with the paletot back and the deep pelerine front. The usual fur-lining is the squirrel-lock; but for this purpose the back of the squirrel as well as the entire skin of the little animal are used; also the fur of the black genet and brown-wool seal.

A silk circular, lined with black genet and a genet bordering five inches wide, was marked $200. Circulars, lined with the full skin of the Siberian squirrel, range in price at from $150 to $300, according to the quality and cost of the materials; and trimmed or bordered with black marten, fisher-tail, genet, brown-wool seal, or silver-fox, the price is advanced in proportion to the cost of the trimming—from $175 to $350, generally covering the cost of the garment. A silk Dolman mantle, lined with squirrel-lock and bordered with silvery-beaver, was held at $125; and a Dolman mantle, lined with black genet, commanded the same price. A very deep silk Dolman, lined with squirrel lock and trimmed with brown-wool seal, was marked $155; while a deep sacque-cloak of silk Sicilienne, cut with wide, square Hungarian sleeves, trimmed with brown-wool seal, was held at $125. Jackets, lined with squirrel-lock, range in price, for those of the most simple make and inexpensive materials, at from $30 to $45; and lined with squirrel-lock and edged with the fur of the squirrel's back, according to the quality of the materials employed, they range in price from about $40 to $125—at the last-named figure an elegant article being shown, with cuffs, collar and pocket-flaps of silvery-beaver.

There never has been a season in which furs for trimming are so extensively used as the present. For costumes, chinchilla will, perhaps, be the most prominent fur. Arica chinchilla bordering, 2¼ inches wide, sells at $1 per yard; four inches wide, it sells in the best quality at $14 per yard; while the Bolivian chinchilla, four inches wide, sells at $6, and wider at $8 per yard.

Fisher-tail bordering, according to width, sells at $10, $14, $16 and $20 per yard.

Silver-fox bordering, according to width, sells at $8, $10, $12, and $15 per yard.

Black genet commands about $4 per yard.

Colored lynx sells at $1, $2, and $3 per yard.

Natural coon sells at $1.50, $2, and $3 per yard; and colored coon at $2, $3, and $4 per yard.

Brown silvery-beaver commands from $2 to $4 per yard; borderings of the black silvery-beaver sell at from $4 to $5; and of the plain black beaver, at $1.50, $2, $3, and $4 per yard.

There are, also, borderings of the blue fox, silver cony, muskrat, and various other furs, more or less costly, according to quality.

Russia hare, a new fur and yet to be tested in popularity, sells, in borderings, at from $1 to $5 per yard.

Black marten commands, according to quality and width of bordering, $1.25, $1.75, $2.25, and $3 per yard; while silvery black marten, in bordering three inches wide, sells at from $4.50 to $8.50 per yard.

Bordering of sea-otter sells at $10 per yard; brown-wool seal, $3; gray Siberian squirrel, fine quality, $3; natural gray fox, $1.50, $2.25 and $3.50 per yard.

For information received, Messrs. C. G. GUNTHER'S SONS, 184 Fifth Avenue, New York, will please accept our thanks.

HER DIARY.—"And swinging his baton above his head."

The Story-Teller.

WINTER AND THE FIR-TREE.

"You wish to hear about Winter?" said the Fir-tree to the other trees of the forest. "Very well, then! Lay aside your prejudice against him, for I know you dislike him. Do not imagine that I am partial because he is my friend. I am only true, because I know him. But to the point. When God Almighty had created the world, when flowers flourished in the fields and trees in the forest, He called the Seasons and spake:—'Look how beautiful the earth is! I give it to you, share flowers and trees among you, but love them and take care of them too.' The Seasons were very happy and reveled with the children of Nature.

"This lasted a while, but soon discord began to creep in among them. Bold, restless Spring could not get on with slow, circumspect Winter; glowing Summer thought Autumn phlegmatic; Autumn upbraided Spring for spoiling the flowers; in short, the strife became more and more vehement, and trees and flowers came off the worst. Then said Autumn, 'This will not do any longer. We cannot tolerate each other; let us divide.'

"And so it came to pass. The Seasons divided the earth. Winter built his house at either pole; Summer wound itself round the center of the earth, and Spring and Autumn created their dominion between them. You will see later on that this division did not continue, but is very nearly the same, and Winter still dwells in his old house."

"How do you know?" asked the Lime.

"My cousin told me; he visited him there once.'

"Take care—he is telling us a fib," whispered the Poplar to her neighbor.

"How could your cousin visit him?" asked the Lime; "is he not obliged to stand fast as we do?"

"It happened thus," answered the Fir:—"One day some bold, enterprising men came to seek wood to build a ship. My cousin—a straight, tall fir—stood proudly among the other trees of the forest. No sooner did they espy him than they felled him and turned him into a mast. Then they went to sea. The sailors put a large cloth round my cousin and said, 'Hold it fast!' On his head they planted a gay, fluttering pennant. My cousin was very merry during the voyage and did his duty thoroughly; and when the wind came and tried to take away his cloth, he held it fast and did not bend; therefore the sailors esteemed him above all the other timbers in the ship. They sailed constantly northwards and suddenly they reached Winter's house. It looked plain but strong and when the ship knocked, Winter stepped out, quite amazed at such a rare visit. But it occurred to him that when he comes he is seldom kindly received; therefore he did not feel stirred to hospitality, and shook his head so that the white flakes flew about. Then he perceived my cousin, and as he is very favorably inclined to us fir-trees, he at once became friendly, and entered into conversation. He wished to know all about each one of us and, when the mast had given him all the information, he also began to relate most wonderful stories, and what I am telling you is one of them. The stories never came to an end; and the old man was so happy with his recollections, which he now freely talked over, that he would not let the ship go, and wound himself round it with strong arms. My cousin is never tired of describing the beauty of this scene; but the better he felt, the worse did the ship's crew fare. He heard them consulting one morning. 'Our wood is burnt, our provisions are coming to an end,' said the steersman, "and if the ice does not thaw soon, we shall perish miserably; let us hew down the mast and burn it; it will help us for some time.' When my cousin heard this, he entreated Winter to let the ship go; and, to save his favorite, Winter granted that which he would never have done for the love of men. He melted the ice and the ship and crew returned home safely."

"That was fortunate!" cried all the trees in one voice.

"But now let me return to my story," again said the Fir.

"The earth was divided, and the Seasons had each their own kingdom. Thus it would have remained had not Spring, in his inconstant way, called for another change. He did not like staying always in one spot; so he called the Seasons together and made the following proposal—'Let us divide differently,' said he, 'and as the earth belongs to us in common, not remain fixed to one spot. Each of us shall have a certain time to possess the earth and rule supreme.' 'I am content,' said Summer, 'if only I may keep earth's girdle for myself.' 'And I the poles,' said Winter. Frivolous Spring agreed to everything as long as he obtained his desire, and Autumn hoped to indemnify himself in some other way.

"Thus the treaty was made and Spring was about to begin his reign, when cautious Winter said, 'But, that *one* may not have everything beautiful in the earth, let us divide that also.' 'Well,' said Spring, 'I claim the buds!' 'To me belong the blossoms!' said Summer. 'The fruits are mine!' cried greedy Autumn; 'and Winter can keep the leaves of the trees.' Winter was not averse to this.

"The treaty was concluded and Spring began his reign. He kissed forth buds on trees and flowers; everything smiled on him. When the buds opened—when flowers and leaves gloried in a thousand colors, Summer took the throne of the earth. But order began to be disturbed at once; for Autumn, always intent on his own advantage, made a special contract with Summer. He was to give him flowers in exchange for fruit; but it is said Autumn did not fare badly, and kept the best for himself. Now came his reign; he gathered in busily the fruits, which he had a right to do. But something else had happened by which poor Winter was much cheated. You remember that according to the division the leaves of the trees belonged to Winter. But in the glowing season of love, when up above hung leaf upon leaf, and down in the grass the flowers shone, unfolding coquettishly their many colors, love sprang up between flowers and leaves.

"This love began, as it often does, with various teasing little ways. When the sun tried to shine, warm and glowing, on the flowers, the leaves of the trees interposed; but ere the flowers were aware of it they bent down, so that the sunshine suddenly fell on them, quite dazing the little ones. The flowers closed their eyes and the leaves tittered among the branches. Or when a refreshing shower came, the leaves saved some drops, and when the flowers thought all was over they poured them down, frightening the flowers, who shook their heads. What was at first only teasing soon became a service of love; for the sun became hotter and hotter, and the poor delicate flowers would all have withered up had not the leaves caught the fiery arrows of the rays like a shield.

"After this deeper earnestness of inclination, raillery was not sufficient; they sought another bond of union. But up high hung the leaves and the flowers sparkled in the grass. Love can always find a way.

Leaves and flowers soon chose a messenger to carry their sighs up and down—the Ivy. It sprang up among the flowers and wound itself, a green leaf, up to the leaves of the trees, leaf pressed to leaf, the ladder of sweet vows, a silent love-chain. Who does not recognize this beautiful vocation at once! Who is not greeted by the evergreen tendrils as with silent sighs of enthusiastic young love! And flowers and leaves were satisfied with this messenger.

"The reign of Autumn drew to a close, and he began to pluck the remaining flowers on the plain. The leaves faded with longing, and passionately entreated Autumn to let them descend, only once, to their dying beloved ones. And Autumn allowed them to do so, although he had no right in the matter and usurped Winter's power over the leaves. Autumn shook the trees and down fluttered the loose leaves to the earth. Now began a wild life of love indeed. Autumn, who took pleasure therein, played a wild air; the leaves flew in whirling dances round the flowers, until they drooped their heads, weary and fatigued, and the leaves lay down at the last tune that Autumn played, to their everlasting sleep. Then came Winter. Plain and forest received him bare and dreary. Nothing was green for him but we poor Fir-trees; for no flower had chosen to have any love communication with our needles, and the Ivy wound from tree to tree, as though it would erect a triumphal arch for Winter, and from bough to bough, as though it would hide the infidelity of the leaves and give the tree a substitute for their lost, withered foliage. Winter saw this and was touched; and whilst he lashed down the few leaves that remained against their will, solitary and forlorn, here and there on the trees, and chased them angrily over ice and snow, he spoke solemnly to the Ivy-leaves:

"'I will protect you. I will preserve you to the friendly business you have chosen; be, and continue, love's messengers; carry silent greetings from flower to leaf, from Autumn to Spring—build an eternal bridge from season to season! Your vocation is to twine and unite; your evergreen remembrance of plains and forests shall mitigate even Winter's severity.'

"So spake Winter to the Ivy, but he gave us Fir-trees his heartiest attachment and prepared honors for us which you other trees do not share."

"And what are these?" asked the other trees, in an injured tone.

"Winter is the season of feeling," continued the Fir-tree; "therefore he at once recognized and honored this in the Ivy. Men know this, for at no season do they unite so much as in winter. Thus he brings with him the joyful, holy, mysterious festival of Christmas; thus you see in his suite that friendly spirit of the Christmas genius. Men call it the love of friends and parents; but that is not true. When it exercises its magic power, it is all over with human beings. Day and night, during the first half of winter, the mother meditates, because the Christmas spirit is constantly whispering in her ear. And the man who goes out to make purchases at Christmas-time, always brings home more than he intended. He is not attracted by the pretty things; no, it is the Christmas spirit beckoning and whispering and touching the heart, so that the hand opens and constantly, until it has prepared the richest Christmas joy.

"We Fir-trees know this, for we stand in the midst of it all; we are the Christmas-trees, and the good Christmas spirit puts us in the midst of the most beautiful Christmas joy. We are missing neither in the palace nor the cottage. Be the parents ever so poor, still they place a few candles on our branches for the rejoicing children. Gold and silver hang from us, we bear glittering fruits, and children clap their hands at sight of us; for, however beautiful everything else may be, the Christmas-tree is the most beautiful of all—the Christmas spirit envelopes it in its most wonderful and peculiar magic. Perhaps children love the Christmas-tree so much because it is so like a rich childlike spirit. Various sparkling pictures twine round Hope's green boughs; rich and golden it stands, mysterious and inexplicable. But one glowing picture after another vanishes; the gold was tinsel—hopes fade—the secret is solved—the whole mystery vanishes with the last ornament one takes off, and nothing remains but a dried Fir-tree. In the child's spirit one golden dream fades after another; one secret after another, in which it was enveloped, unfolds; and how different is life to what the child's spirit fancied it!"

"When the tinsel is off, your glory is past?" asked the Ash.

"Then the tree is thrown into the fire," said the Fir, "and there he often hears many a beautiful fairy tale, which human beings relate when they sit gazing into the glowing fire. He listens attentively; but if anything is said of which he disapproves, he cracks so that the sparks fly and people round the hearth jump. And when the golden apples are eaten, the children look sadly out of their corner at the burning Christmas-tree."

This is the story of Winter and the Fir-tree.

HER DIARY.

Nov. 30.—It was painful to the last degree. I do not distinctly remember the various operations that finally led to my being laid out upon the table, but when I gained my consciousness I felt some one was grasping me around the waist with no gentle pressure. My breath shot forth in a ridiculously spasmodic fashion that made me squeak laughably—had it not been for the acute pain I suffered.

Who these ruthless people were and why they should thus abuse me, I did not clearly understand. They appeared to be disputing about my possession, and the woman—who acted as if she controlled my destiny—was very persistent about terms. As for myself, I rather fancied my would-be owner, so to speak, as it was clear I was looked upon as a mere chattel, and insensibly I found myself taking a great interest in the negotiations.

I have read somewhere how they buy slaves in the East—examining their teeth, discussing their physical perfections, etc.—and I had time to reflect that my condition was in nowise better than the lot of those poor creatures.

Arrangements were finally made satisfactorily to the interests of both parties, and I was lifted carefully into my new protector's arms and carried to my new home.

Dec. 2.—Fancy the feelings of a poor orphan, a waif, stray, what you will, dear reader, on being ushered into a family that was positively teeming with "olive branches."

What my new owner could want with a larger family than she already had, was a marvel to me. I say "owner," because it seems to fitly express the sardonic cast of my thoughts. It is a dreadfully bitter thing to be cast upon society at my age, forced to fight the battle of life alone, harassed by an ever-present doubt as to the existence of one's parents even. But enough of this moralizing.

The BENSONS were as kind as could be expected and the children made much of me; too much, in fact, as I was a bone of contention. MARY wanted me exclusively, while ANNA insisted that I belonged to her. MILLICENT, more mild and judicial, thought a compromise by which each could possess me a part of the day would save trouble. It was very amusing——to them.

Dec. 5.—What queer children, to be sure! I am coddled to the point of satiety. It would be preposterous to tell the number of times I am dressed and undressed each day, simply to please these young tyrants. I couldn't have less will of my own if I was a creature of the Grand Llama's. My only relief is at night, when I retire to a really cosy room and rest my weary head on a pillow that would do credit to a bridal chamber, so gorgeous is it with laces and fine linen.

Dec. 6.—This has been an eventful day. Early in the forenoon almost the entire family went to the *Matinee*. I should have been pleased to make one of the party, but my pleasure is not always consulted—except by myself, and it was this open-handed generosity to the writer that proved to be my misfortune.

No sooner did I find myself alone than I determined to go about on a voyage of inspection. I should add, perhaps, in this connection, that disease had paralyzed my legs to such an extent that walking was out of the question. This unfortunate circumstance was no bar to my inquisitiveness as, by the assistance of a maid, I visited parts of the house quite new to me. I especially amused myself in the pantry, and I was so deeply engrossed in attempting to extract pickles from a large jar, that I was oblivious to all that passed around me. I must have disturbed some heavy weight as, before I could fall to one side, I was momentarily crushed against the lid of the jar, which made me utter a horrid squeak, similar in sound to those store "cry babies," and which, to my shame, I always give voice to when frightened.

In a twinkling the weight—a large platter—careened. I lost my balance and in we both went, scattering pickles and vinegar in all directions. I gasped, splashed and wriggled, but to no purpose. My head was submerged. I had about concluded that it was my fate to be pickled, when I was caught by the leg and drawn, dripping, from the jar. Nothing could be more ridiculous than such an adventure, or more overwhelming than the shame I felt at being caught in my own trap. The children, who had returned, were hilarious at my expense. A foster-sister is never the recipient of more sympathy and love than she can be grateful for!

I was undressed and put to bed in disgrace.

Dec. 28.—Ecclesiastes says:—"And I gave my heart to seek and search out by wisdom concerning all things that are done under Heaven." But my seeking was of a character that would not be sanctioned by the Preacher. I wanted to know who the young man was that paid such devoted attention to MILLICENT'S elder sister, and why the couple sought bay-windows and other secluded spots, when apparently they had nothing more interesting to discuss than pictures in a photograph album.

I found out; but it was at the expense of an eye, alas!

We had been playing at house-keeping in one of those windows, and when called to dinner the children scampered away, leaving me sitting in one of the chairs. Of course I could not walk away, so patiently waited to be taken to bed when I would have been missed. Time advanced apace, and when I awoke from a quiet nap, I was aware of another presence in my neighborhood. It was too dark to distinguish anything more than the outlines of figures that certainly were very near each other. Presently I heard:

"Oh, GEORGE! please, don't! Why, you impudent fellow!" said in a tone of quasi-annoyance.

It was MILLICENT'S sister and her young man.

He said nothing; but presently I heard a peculiar, sharp report, something like the sound of a cork drawn suddenly from a bottle, and more exclamations on the part of the lady.

Then ensued a very funny scene. As plainly as I could see one shadow lunged in the direction of the other; an incipient scuffle ensued, and in the midst of the fracas the young lady was plumped down on the chair in which I was placed. I saw her coming, and felt much the same helplessness that a Swiss might feel when placed in the direct course of an avalanche. In a twinkling the breath was squeezed out of my body, and along with it issued the sound of one of my musical "squeaks." The girl jumped to her feet, both laughed immoderately, and after a poor sort of apology they carried me to the light.

"Poor MILLICENT, how angry she will be," exclaimed this precious young woman, not seeming to care that I had suffered an internal injury that had the effect of paralyzing my eyelid so that I cannot close it.

Jan. 30.—I am hardly strong enough yet to write, but I feel as if I must relieve my pent-up indignation and sense of injury, or I shall relapse into delirium. It seems more than a month since the cruel accident that nearly caused my destruction.

Christmas is a season brimming with mirth in the home of the BENSONS, and for many days previous to the festival anticipation and preparation are rife. Each member of the family seems to make it a point to prepare some pleasant surprise for all the others, and while these schemes are usually clouded in the most impenetrable secrecy, there are occasions, however, where two or three gather together and decide on a combined surprise to the unsuspecting minority. Of one such scheme I was and am the victim.

The children thought it would be a fine thing to do, if they could manage a Christmas carol among themselves, without the aid of maturer talent, and to this end Master GEORGE marshaled his three sisters, and in secret conclave the programme was fixed up satisfactorily. The rehearsals were great fun, to me at least. The melody was,——well, the less I say about that the better the singers will be pleased.

Christmas Eve was set apart for a private rehearsal, and although the affair was to be very quiet, it leaked out gradually, and a few friends—neighbors—came in. Myself and the neighbors formed the audience. I had the seat of honor, being perched on a bench, with one companion by my side, in what might be termed the dress circle.

The performance opened without delay or confusion. Master GEORGE stepped upon a bench and, holding his baton aloft, essayed the duties of conductor. It was very interesting. One passage in the score demanded extraordinary vigor of voice, and the conductor, rising to the occasion, stretched upward and backward, poising himself on his toes and, swinging his baton above his head, shouted, "*Now*, all together, one, two, three——."

I heard no more, as, losing his balance, he fell backward, carrying destruction in his wake. I only had time to grasp my companion's hand, when down he came upon us with the force and precision of a pile-driver. Giving one terrific squeal, I fell, flattened beyond all hope of recognition. My side was rent in twain, and scattered about the floor were great pools of my life-sawdust.

Instead of rushing to my rescue, the heartless children were convulsed with demoniac laughter, and gave tongue to the most cruel jests.

But what did they care—*I was only a doll!*

C. H. E. R.

MEDICAL SCIENCE IN SERBIA.

THE London Standard gives a unique picture of Serbian medical resources:—Serbia has hitherto done without doctors. In a few of the large towns, no doubt, there were medical men, mostly brought up in Vienna, but in the villages there was absolutely none. Their place was—I should perhaps say is—supplied by "wise women" called "babas." These "babas" profess to have an intuitive knowledge of medicinal plants; but that intelligent being, the Serbian peasant, placed much less trust in their medical than in their magical skill. Their performance in this line was remarkable, and their rustic patients had every faith in it. The most commonly fatal diseases in Serbia are consumption and congestion of the lungs. The staple remedy for the latter ailment is to administer to the patient three apples grown on the same bough. If after eating these apples, which are supposed to have some mysterious connection with the Trinity, the patient feels no better, then, but not till then, the wise woman adopts more vigorous measures. The unfortunate *malade* is laid on the ground on his stomach, the wise woman scatters salt over him, and marches around him mumbling cabalistic words. This seems to be a kind of exorcism, and would indicate a belief that the illness is caused by witchcraft or demoniacal possession.

No man, for any considerable period, can wear one face to himself and another to the multitude without finally getting bewildered as to which may be true.

WERE all men to bring together their burdens of sorrow to be equally divided, each on reflection would choose his own.—*Socrates.*

A CHRISTMAS HYMN.

'Twas in the calm and silent night.
The Senator of haughty Rome
Impatient urged his chariot's flight,
From lordly revel rolling home.
Triumphal arches, gleaming, swell
His breast with thoughts of boundless sway:
What recked the Roman what befell
A paltry province far away
In the solemn midnight
Centuries ago?

Within that province far away
Went plodding home a weary boor;
A streak of light before him lay,
Fallen through a half-shut stable door
Across his path. He passed—for naught
Told what was going on within,
How keen the stars, his only thought,
The air how calm and cold and thin
In the solemn midnight
Centuries ago.

* * * * * *

It is the calm and solemn night.
A thousand bells ring out and throw
Their joyous peals abroad, and smite
The darkness, charmed and holy now.
The night that erst no name had worn,
To it a happy name is given.
For in that stable lay new born
The peaceful Prince of earth and heaven,
In the solemn midnight
Centuries ago.

TOLD AND FORETOLD.

Now the birth of Jesus Christ was on this wise: When his mother Mary was espoused to Joseph, before they came together, she was found of child of the Holy Ghost.

Then Joseph her husband, being a just man, and not willing to make her a public example, was minded to put her away privily.

But while he thought on these things, behold, the angel of the Lord appeared unto him in a dream, saying, Joseph, thou son of David, fear not to take unto thee Mary thy wife: for that which is conceived in her is of the Holy Ghost.

And she shall bring forth a son, and thou shalt call his name JESUS: for he shall save his people from their sins.

Now all this was done, that it might be fulfilled which was spoken of the Lord by the prophet, saying,

Behold, a virgin shall be with child, and shall bring forth a son, and they shall call his name Emmanuel, which being interpreted is, God with us.

Then Joseph being raised from sleep did as the angel of the Lord had bidden him, and took unto him his wife:

And knew her not till she had brought forth her first-born son: and he called his name JESUS.

Now when Jesus was born in Bethlehem of Judea in the days of Herod the king, behold, there came wise men from the east to Jerusalem,

Saying, Where is he that is born King of the Jews? for we have seen his star in the east, and are come to worship him.

When Herod the king had heard these things, he was troubled, and all Jerusalem with him.

And when he had gathered all the chief priests and scribes of the people together, he demanded of them where Christ should be born.

And they said unto him, in Bethlehem of Judea: for thus it is written by the prophet,

And thou Bethlehem, in the land of Judea, art not the least among the princes of Judea; for out of thee shall come a Governor, that shall rule my people Israel.

Then Herod, when he had privily called the wise men, inquired of them diligently for the time the star appeared.

And he sent them to Bethlehem, and said, Go and search diligently for the young child; and when ye have found him, bring me word again, that I may come and worship him also.

When they had heard the king, they departed; and, lo, the star, which they saw in the east, went before them, till it came and stood over where the young child was.

When they saw the star, they rejoiced with exceeding great joy.

And when they were come into the house, they saw the young child with Mary his mother, and fell down, and worshiped him: and when they had opened their treasures, they presented unto him gifts; gold, and frankincense, and myrrh.

And being warned of God in a dream that they should not return to Herod, they departed into their own country another way.

And when they were departed, behold, the angel of the Lord appeareth to Joseph in a dream, saying, Arise, and take the young child and his mother, and flee into Egypt, and be thou there until I bring thee word: for Herod will seek the young child to destroy him.

When he arose, he took the young child and his mother by night, and departed into Egypt:

And was there until the death of Herod: that it might be fulfilled which was spoken of the Lord by the prophet, saying, Out of Egypt have I called my son.

JOHN 14, 27: Peace I leave with you, my peace I give unto you.

PS. 119, 165: Great peace have they which love the law; and nothing shall offend them.

ISA. 32, 17: And the work of righteousness shall be peace.

JER. 14, 13: I will give you assured peace.

Ladies' Portfolio.

A CHRISTMAS CAROL.

I.

In the bleak mid-winter
Frosty wind made moan;
Earth stood hard as iron,
Water like a stone;
Snow had fallen, snow on snow,
Snow on snow,
In the bleak mid-winter
Long ago.

II.

Our God, heaven cannot hold Him
Nor earth sustain,
Heaven and earth shall flee away
When He comes to reign:
In the bleak mid-winter
A stable-place sufficed
The Lord God Almighty—
Jesus Christ.

III.

Enough for Him whom Cherubim
Worship night and day,
A breastful of milk
And a mangerful of hay;
Enough for Him whom Angels
Fall down before,
The ox and ass and camel
Which adore.

IV.

Angels and Archangels
May have gathered there,
Cherubim and Seraphim
Thronged the air;
But only His Mother
In her maiden bliss
Worshiped the Beloved
With a kiss.

V.

What can I give Him,
Poor as I am?—
If I were a Shepherd
I would bring a lamb;
If I were a Wise Man
I would do my part,—
Yet what can I give Him,—
Give my heart. [*Christina Rossetti.*

LEAF PHOTOGRAPHS, AND HOW TO MAKE THEM.

BY PROF. WILLIAM ROB'T BROOKS.

ALTHOUGH one of the first applications which was made of the photographic property of light, was the obtaining of impressions of lace, leaves

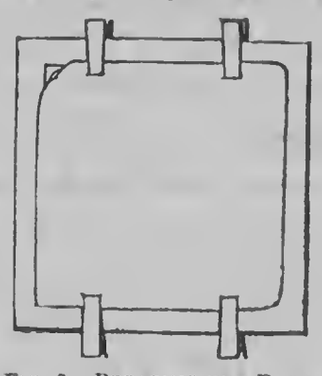

FIG. 2.—PEPARING THE PAPER.

and ferns upon sensitive paper, of late years it has never been practiced to that extent, or received that attention which the beauty of the results in our opinion seems to demand.

The practice of the art of making leaf photographs is so simple and easily acquired by any one of taste, whether having any previous knowledge of chemistry or not, that the following directions will enable any of the readers of the RURAL to produce them with ease and certainty.

PREPARATION OF THE PAPER.

The first thing to do is to prepare the solution for sensitizing the paper; that is, to prepare the paper in such a way that when exposed to the light it will turn black. There are several ways of doing this, but the simplest, and at the same time that giving the most brilliant results, is the following: Dissolve one ounce of nitrate of silver in twelve ounces of pure water (melting ice ist he most convenient way to obtain it), add two drops of liquid ammonia and two grains of alum. Filter through paper or a tuft of cotton placed in the neck of a glass funnel. Keep this solution in a glass stoppered bottle until required for use.

Procure of the photographer in your neighborhood a few sheets of albumenized paper. This is a paper made expressly for the purpose and coated with the whites of eggs in which has been dissolved some chloride salt, usually ammonium. The silvering or sensitizing of the paper should be done in a moderately dark room by the light of a lamp, or in a room in which the windows are covered with yellow paper, for *yellow* light will not affect the sensitive paper.

Pour the silver solution into some flat dish of earthenware or glass,—a flat pie dish answers well for experiment,—then having cut the paper into sheets a little smaller than the dish, take one of them and very gently lay the same down upon the surface of the silver solution, albumen side downwards, and be careful not to let any of the solution flow on to the back of the paper. Should it curl up, *breathing* upon the back of the paper will make it lie flat. Let it float from one and a-half to two minutes, then gently lift it off by one edge, and pin it up against a board to dry. When dry it must be *fumed* by hanging or pinning it to the top of a box (a clean soap or candle box will answer) and pouring into a saucer in the bottom of the box a few drops of strong liquid ammonia. Let it remain there about ten minutes. Our paper is now ready for the "printing," or to receive the impressions by the action of light. It

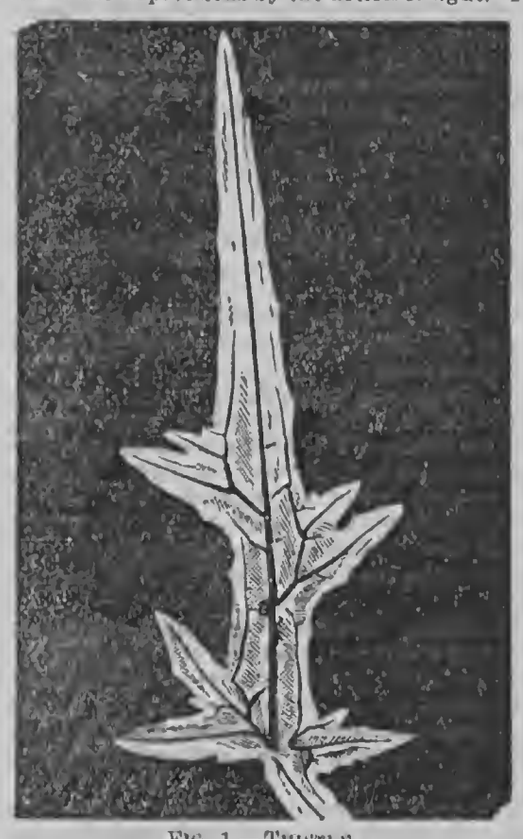

FIG. 1.—THISTLE.

must be carefully kept in a dark box until wanted for use, as it would turn black if exposed to the light. It should also be prepared the same day it is to be used, as it deteriorates by keeping. We are now ready for

THE PRINTING.

Procure a number of pieces of clear glass—say four inches wide by five inches long, and others 2½ wide and four long, some pieces of thick cloth the same size as the larger pieces of glass, also a few spring clothes pins. Then having selected the leaf—which we will suppose to be a rose-leaf—lay it face down upon the middle of one of the larger pieces of glass, then upon the leaf a piece of the sensitized paper (albumen side next to the leaf), upon that a piece of cloth, two of the smaller pieces of glass, and clamp the whole together at the edges by four of the clothes clips—as shown in Fig. 2; then place the whole in strong sunshine, leaf side uppermost. The paper around the leaf will be seen to rapidly darken, and after four or five minutes it should be taken in from the light and examined by removing one of the narrow pieces of glass at the back, turning down the paper to see if the impression is sufficiently deep. When such is the case, not only will the outlines of the leaf be accurately shown, but every vein, fiber and delicate marking of the internal construction—a result beautiful in the extreme. If it is not printed deep enough to show all these markings plainly, restore the parts to their places and expose again to the light.

WASHING, TONING AND FIXING.

After a sufficient number of copies are made of this or other leaves, the photographs must be washed, toned and made permanent for, as they come out of the printing frame, they would soon spoil. The prints are first washed by soaking in several changes of clean water in an earthen dish, after which they are immersed in the "toning bath" made as follows:—Procure of the dealer or some photographer, a few grains of chloride of gold, and dissolve in water at the rate of one grain to the ounce. Keep this for a stock solution. When ready to tone, pour into an earthen dish enough water to cover the prints, add say half an ounce of the gold solution and a pinch of bicarbonate of soda. Immerse the prints in this. They will at first turn slightly reddish, but in a few minutes will change to a beautiful rich black. They should now be removed, immersed in water, and placed in the "fixing bath," composed of hyposulphite of soda one ounce, water six ounces.

FIG. 3.—FERN.

Allow them to remain about ten minutes, when they should be taken out and washed in several changes of water for a number of hours, dried and mounted upon cards with good flour or starch paste.

Nothing can exceed the beauty of these leaf prints when properly made. All kinds of leaves can be used, but those in which the veins are strongly marked should be chosen. Ferns, dried or green, make beautiful subjects, and at this season of the year the leaves of a large number of our house plants will afford the amateur delightful occupation, giving him a good experience and practice for the larger range he will find in outdoor vegetation the coming season.

I give in connection with this article, two views of different kinds of leaves from actual specimens. By following the above directions with care and cleanliness, avoiding contamination of the different solutions, all may succeed in this fascinating art. I will, in some future article, give directions for making fern and leaf mottos on this principle.

Phelps, N. Y., Dec.

Reading for the Young.

THE HOLIDAYS.

Ah! don't you remember! 'Tis almost December,
And soon will the Holidays come;
O, 'twill be so funny! I've plenty of money.
I'll buy me a sword, and a drum.

Thus said little Harry, unwilling to tarry,
Impatient to hurry from school;
But we shall discover, this holiday lover,
Spoke both like a child, and a fool.

For when he alighted, so highly delighted,
Away from his sums and his books,
Though playthings surrounded, and good things abounded,
Chagrin still appeared in his looks.

WINTER EVENING AMUSEMENTS—No. 3.

Though first they delighted, his toys were now slighted,
And thrown away out of his sight:
He spent every morning in stretching and yawning,
Yet went to bed weary at night.

He had not that treasure which really makes pleasure,
(A secret discovered by few;)
You'll take it for granted, more playthings he wanted:
O no, it was something to do.

He found that employment created enjoyment,
And passed the time cheerful away;
That study and reading, by far were exceeding
His cakes, and his toys, and his play.

To school now returning, to study and learning
With pleasure did Harry apply;
He felt no aversion to books; 'twas diversion,
And caus'd him to smile, not to sigh.

CHRISTMAS.

MY DEAR CHILDREN:—Although it has been your delightful privilege to celebrate the birth of our Saviour, doubtless it has not occurred to many of you to inquire into the origin of this festival, or how it is observed in other lands than ours.

How expectantly we look for the coming of SANTA CLAUS, feeling sure the genial old fellow will not have forgotten us, notwithstanding we may have more or less deserved a somewhat smaller recognition than we provided for, judging by the length and capacity of our stockings. But what would you think, my charming little neice and robust young nephew, if your old fogy Uncle should fetch you a nice, sleek, insinuating switch, and you could not tell the antecedents of the donor? You would say, I think, that its application was deserved in a way and place quite foreign to the intentions of him who gave it.

SANTA CLAUS, who, since taking out his naturalization papers, has become ST. NICHOLAS, came to these shores with our Dutch forefathers, landing in New York. A fellow naturally so secretive and mysterious in character would have many aliases, as a matter of course, so when we discreetly inquire into his Old World history and belongings, we are met by still another name. Before leaving Germany for Holland he was known to a large and enthusiastic clientage as Knecht RUPERT. Habited in a white robe, high buskins and a huge flaxen wig, he swung a basketful of presents over his shoulder and trudged through the snow to the houses of his friends. His coming was not an unmixed blessing, because of a queer habit he had. He would sternly question the parents as to the conduct of his little friends during the year, and on this impartial report would largely depend the rewards bestowed on the deserving. Hence, Knecht RUPERT was a name not always mentioned with jovial frankness among children.

The salubrity of our climate or our fast way of living has told even on so conservative a fellow as SANTA CLAUS, as we find that he now disdains to trudge on foot, when reindeers are procurable, and instead of asking annoying questions, takes it for granted American children are the best in the world, even going so far as to wink at trifling subterfuges, such as feigning to own stockings that in most cases would adequately serve as an entire garment for the wearer!

In some districts in Germany RUPERT is not on visiting terms, in which case recourse is had to Christmas trees. The presents are hung tastefully from branches that are cheerfully lighted up. The name of the person for whom the gift is intended is inscribed on it, but in no case the name of the giver. Immediately succeeding the distribution of the presents a very wholesome, but not particularly delightful, scene ensues. The mother takes this occasion for saying to the girls, privately, and the father to the sons, what has been observed most faulty in their conduct, with wise counsel for future guidance.

In merrie England Christmas is a great holiday, and in former times the ceremonies extended until Candlemas (Feb. 2), every day being a holiday until Twelfth-night (Jan. 6). The nobles did things on a grand and generous scale. A "lord of misrule" was installed, whose duty it was to invent or suggest the games, pastimes, etc. What visions of good things picture themselves to our imagination, when we read of larders fairly bursting with everything that would tempt the most austere anchorite. Indeed, so proverbial was this season for feasting and plenty, and so great were the preparations to supply healthy British appetites, that the Italians have a proverb indicating commercial activity, which says, "He has more business than English ovens at Christmas." Glowing fires burned in most capacious fire-places, the main reliance being the yule log, which custom prescribed should be burned until Candlemas Eve.

You have all heard of soused boar's head, which was the main dish, and borne to the principal table with great pomp and solemnity, "upon a silver platter, with minstralsye."

It may never have occurred to you that the pretty custom of decking our churches and houses with greens is not derived from Christian tradition, but is, on the contrary, very heathenish; which should admonish us to view with great liberality the career of those whom we think are inferior, as the spirit of Charity—the most blessed of spirits—could only have animated the hearts of those who believed that by so using evergreens sylvan spirits would find shelter, and remain secure from King Frost until a milder season. We owe this practice to the Druids.

In Roman Catholic countries Christmas is not to so large an extent a domestic festival as among Protestants. The church services are much grander, the pomp and ceremony going to uncommon lengths in Italy and France. Christmas is ushered in by three masses, one at midnight, at which hour it is supposed the Saviour was born. This custom dates, however, from the Sixth Century only. It is a period of great honor to the Virgin MARY, her counterfeit presentment being carried around in procession, decked out in raiment that fairly dazzles.

The custom of singing carols, which were intended to emulate the songs of the Shepherds, dates from the time when the common people ceased to understand Latin.

Traditions referring to Christmas are numerous; many singularly lovely. In Devonshire the oxen were supposed to fall upon their knees at midnight and moan like humans. A hawthorn, supposed to be a part of the staff of JOSEPH of Arimathea, legend says, was planted on the eve of the Crucifixion, and immediately budded and was on the following day covered with flowers. This remarkable shrub was supposed to bloom regularly on Christmas day, and persons traveled great distances to behold the miracle. Twelfth-day is thought to be in honor of the magi, who brought presents to the Bethlehem manger.

Some very pretty Christmas games are played in England, especially noteworthy being a Twelfth-Night party. I think I can commend it to some of my enterprising little relations, who may happily enliven the evening by its means.

First we must make and bake a fine cake—visions of a huge frosted plum cake haunt me—and inside of which is placed a dried pea and bean. The extent of ornamentation on such a cake can be limited only by the resources of the pantry or

our purses. Then we want some slips on which are written a few rhymes, or bearing a picture. These are the "characters." The slips are numbered and those meant for the girls are put in one box, while the unknown fortune of the boy is placed in another. The young folks being assembled, the cake is cut, and the boy who draws the bean is proclaimed king, while the girl who gets the pea is, for the nonce, a beautiful queen. Their majesties are duly enthroned and the "characters" are distributed among the rest of the company, each one being expected to read the verse aloud, which should be a comical one, and to personate the character drawn from the box. The sequel of fun depends entirely on the genius for un possessed by the party.

Now, my young friends, I think I have expatiated at sufficient length on the customs of one of our most cherished holidays, and I can close no more fittingly than by wishing all of you a very, very merry Christmas. A lonely sellishness leads me to add, that in the midst of your mirth you will kindly pause a moment to think of one old fellow, whose heart yearns most tenderly towards his many unseen relatives, and who frankly confesses that his pleasantest memory will be that, perhaps he is receiving, as *his* Christmas present, a part of the affection of those to whom, at first duty and finally inclination, has most tenderly attached him. Again, "A Merry Christmas" to all, and countless returns of the holiday to those who are not as old as UNCLE TRUE.

LETTERS FROM BOYS AND GIRLS.

A Beginner.

WELL, to be sure! Did you ever! Just pass around Webster's Unabridged Dictionary and Comstock's Philosophy. Here is a letter from a city editor. I would know he was a city chap, because he calls himself a "pumpkin." What do you say, farmer boys, isn't he a big gourd, just a little green? Girls, step in lively, and scatter the Italics; it will do him good. I am just waiting for the fun. We are all expected to have some pets. I had some flowers, but the grasshoppers gobbled them before the seed was ripe. I hope something will eat the hoppers next spring, then I will be ready to commence again on nothing. I would like to tell you about my Sabbath school. I like it very much. Kind regards to all, if you let me in.—W. T., *Kansas.*

P. S.—Shall I write again, and will I be welcome?

[Of course.—UNCLE TRUE.]

From an Allegany Co. (N. Y.) Boy.

DEAR OLD RURAL:—I see there are a great many boys and girls writing, so I thought I would write a few lines and see if they would be printed. My father is a farmer. We keep twenty-three cows and make butter. I have four sheep and a pair of doves. I have a cat that I have trained to drive in a little wagon. I am seven years old. My father has taken the RURAL more than twenty years. We think it the best paper in the world.—E. C.

The Puzzler.

MISCELLANEOUS ENIGMA.

I AM composed of 39 letters:

My 33, 27, 13 23 a Territory of the United States.
My 11, 7, 30, 26 a city of great repute.
My 16, 37, 12, 27, 29, 11 a favorite article of food.
My 9, 19, 34, 7, 11 what we all should have.
My 22, 6, 21, 21, 13, 11 a coin.
My 35, 11, 2, 15 a town in Iowa.
My 34, 10, 18, 24, 30, 12, 8, 29, 11, 31, 13, 30 the ancient name of a popular city of the United States.
My 25, 13, 14, 28, 4, 24 an idol god of the Hindoos.
My 14, 24, 39, 21 a king of Israel.
My 12, 35, 31, 32, 30 a city of ancient times.
My 30, 20, 21, 10 a beast of burden.
My 5, 17, 11, 27, 21 10 an aqueous animal.
My 3, 8, 36, 15 a post town in Georgia.
My whole is a valuable maxim.

ACKNOWLEDGMENTS.—Answers to Transposition in RURAL of Dec. 9 have been received from Mrs. K. I. SMITH, Mt. Kisco, and C. L. E., Middle Falls, N. Y. A solution to Geometrical Puzzle published Nov. 18 was received from CORNELIA L. BEATTIE, Wildwood, Kas., but escaped notice until now.

PUZZLER ANSWERS.—Dec. 9.

CROSS-WORD ENIGMA.—Daniel Deronda.

TRANSPOSITION.—

Suppose, my little lady,
Your doll should break her head,
Could you make it whole by crying
Till your eyes and nose are red?
And wouldn't it be pleasanter
To treat it as a joke,
And say you're glad 'twas Dolly's
And not your head that broke.

Suppose you dress for walking,
And the rain comes pouring down,
Would it clear off sooner
Because you scold and frown?
And wouldn't it be nicer
For you to smile than pout,
And so make sunshine in the house
When there is none without?

PUBLISHER'S NOTICES.

TO THE LADY READERS OF THE RURAL.

SPECIAL OFFER OF RARE PLANTS AND SEEDS

HAVING a few choice plants now growing in the RURAL'S EXPERIMENTAL GROUNDS, which we think would be desirable to some of the lady readers of the RURAL NEW-YORKER, we make the following offer:

Those who, in renewing their own subscription, send us an additional name (not already on our list) with the sum of $4.00 for the two, may select any two of the following-named plants and a paper of the seed of the Molucca Balm. Those who receive these premiums can divide with their friends, or keep them all, as they may agree among themselves, as our object in making the offer is to induce old subscribers to send us new ones, thereby increasing our list. The plants and seeds offered are very choice, as will be seen in description given below. The plants will be sent by mail free, and carefully packed and forwarded immediately on receipt of subscriptions.

Abutilon Boule de Neige.—The best of the *Abutilons*. Its flowers are large and white. It blooms throughout the whole year and therefore is alike desirable for the conservatory and garden.

Marie Lemoine.—Among a hundred or more varieties of double-flowered *Pelargoniums*, new and old, this is yet unrivaled. The individual flower, of a delicate rose color, as well as the truss, are the largest of their class.

Hydrangea paniculata Grandiflora.—So much has been said of this new Japanese shrub during the past year that little need be added now. It begins blooming in early August, continuing until after hard frosts.

Variegated Ampelopsis or *Vitis heterophylla variegata.*—We do not hesitate to pronounce this one of the most attractive vines in cultivation. The leaves are deeply-lobed and variegated with white and green.

Jerusalem Artichoke.—Believing that the Jerusalem Artichokes are exceedingly valuable as food for all kinds of farm stock, we place them among our valuable premium plants. They will yield more bushels of tubers per acre than the common potato and we believe them more valuable for feeding purposes; besides the Artichoke will grow vigorously where the potato would fail entirely. We will send one-half pound each of the Long Purple and Round White, for each new subscriber as above, or one pound of the tubers of either variety. We shall store a quantity of the tubers in the cellar for sending out this winter; but those of our subscribers who reside north of the latitude of New York City had better leave their plant premiums in our hands after the first of January until early spring. We will, however, "book" all orders received during the winter, to be sent at the earliest possible moment.

Achania malvaviscus or Malvaviscus arborens.—The flowers are bright red, of a turban shape, two inches long. It blooms incessantly whether indoors or out. In the conservatory it may be trained so as to cover wood-work as readily as a vine. Its growth is so rapid that small plants set out in the spring will cover a space four feet in diameter by fall. As a plant for the sitting-room, the little care it needs, its perpetual scarlet flowers, contrasting elegantly with its golden-green, plush-like leaves—its endurance of dry heat and dust render it most pleasing and satisfactory. We commend this plant with confidence.

Moluccella laevis.—We will send, also, to ALL who are entitled to a choice of any two of the above plants, a package of the seeds of the beautiful Shell Flower, an account of which and an engraving were given in the RURAL of Aug. 17, p. 117.

TERMS FOR 1877, IN ADVANCE,

INCLUDING POSTAGE, WHICH PUBLISHERS PREPAY.

Single Copy, $2.50 per Year. To Clubs:—Five Copies, and one copy free to Agent or getter up of Club, for $11.25; Seven Copies, and one free, for $16.05; Ten Copies, and one free, $20—only $2 per copy. The above rates *include postage* (under the new law) to any part of the United States, and the American postage on all copies mailed to Canada. On papers mailed to Europe, by steamer, the postage will be 85 cents extra for each subscription. Drafts, Post-Office Money Orders and Registered Letters may be mailed at our risk. ☞ Liberal Premiums to all Club Agents who do not take free copies. Specimen Numbers, Show-Bills, &c., sent free.

News of the Week.

HOME NEWS PARAGRAPHS.

A new industry has been started in Hancock Co., Maine—extracting tannin from sweet fern. From a ton of sweet fern a barrel of extract tannin is made, worth $22, and also a barrel of second quality, worth $7.52 per barrel.

Hunters report that the black squirrel, once so numerous in Southern Michigan, is rapidly disappearing.

A job lot of Maine islands, sixty-two in number, were auctioned off at Rockland, the other day. The whole of them only brought $1,500.

John Bright spoke in England against that government's Eastern policy.

The American plan for sending fresh meat to Great Britain is succeeding admirably. A system has been organized by which 3,000 quarters of fresh beef can be sent over in each steamer, not frozen, but cooled to a safe temperature by air which has passed through ice-chambers. In spite of opposition from the butchers, a cargo was sold in Liverpool a fortnight ago at from 6d. to 8d. a pound. The meat has fetched 8d. per pound in Glasgow for some time.

The Director of the Mint says the country has half enough gold to resume specie payments.

The Press Association reports that the Cambridge University Boat Club has declined the challenge of Yale and Cornell Universities to a four-oared race on the Thames from Putney to Mortlake in August, 1877.

The National Banks have made bad debts to the amount of $19,712,000 during the last fiscal year.

California wheat is selling for $1.65 per bushel

The gold yield of California this year is estimated at $20,000,000.

A Washington correspondent says that the separation by divorce of Mary Clemmer Ames and her husband was not the result of any quarrel, but because it was necessary for her to live in Washington while his business kept him in Harper's Ferry, and that enforced separation, added to the great difference in their ages, convinced them that they would both be happier free.

Dr. Forbes Winslow records the startling fact that over 10,000 persons of unsound mind are confined in the lunatic asylums of the United States, driven mad from over-excitement on the subject of spiritualism, and that insanity from the same cause is prevalent in England, and increasing every day.

A Colorado woman has collected fifty bushels of grasshoppers, and scalded and dried them for winter chicken feed.

Hing Lee, the richest Chinaman in Montana, was recently murdered at German Gulch. His murderers got about $50,000.

A milder feeling is said to prevail in political consels.

The President says he does not anticipate any disturbances.

Senator Morton made a hasty trip to his home, and rumors of all sorts are rife.

The Democrats are not in accord in counsel.

The 22d joint rule is not yet laid at rest.

A very large number of bills are before Congress which were left over from the last session, but it is not probable that one-fourth of them will be acted upon. The calendar of the Senate shows that 212 bills are pending before that body, besides a number of resolutions. Seventy-four of the bills now before the Senate have been passed by the House and 138 are Senate bills, many being of minor importance. The calendar of the House of Representatives shows that there are 42 bills of a public nature and 231 of a private character pending before that body.

The Senate bills to restore the franking privilege, for the protection of agriculture against injurious insects and to provide for the construction of a new library building, in Washington, will be called up this session.

In the mandamus case before the Supreme Court, on the 16th inst., the defendant made an answer which, after argument, the court characterized as insufficient, and ordered that it be amended and brought into court by Monday morning, the 18th inst., at 10 o'clock. There is a general impression that the court will issue the mandamus and that a new canvass will be made. This new canvass will operate directly on the State and Congressional tickets alone, though it will of course have an indirect influence on national politics. The face of the returns, on which the new canvass, if ordered, will be made, will give Drew a large majority and elect both Democratic Congressmen. The decision of the court will hardly be reached before Tuesday or Wednesday.

The Investigating Committees are at work.

The recent gale has damaged the shipping extensively.

FOREIGN NOTES.

THE international commission to survey the proposed interoceanic canal route through the Isthmus of Darien arrived about the 1st inst. at Aspinwall by a French steamer. Lucien N. Bonaparte Wyse commands the expedition, and has under his direction V. Cellier, a French engineer; W. Brooks, an English engineer; Gerster and G. Musso, engineers, respectively from Austria and Italy, and also engineers Millet, Baudoin, Barbiez, Merendol, Giganti and Lenoff, with Dr. Vizier, naturalist, and A. Reclus, marine officer. The commission were to leave immediately for Panama, where they were to incorporate among their number four engineers from the United States. Operations will begin with the opening of the dry season.

The commanders of the Southern army have received orders to be ready to cross the Pruth into Roumania, where trains have been engaged to transport the troops to the Danube. Northern Bosnia is entirely denuded of Turkish troops. Renewed outbreak and lawlessness are feared.

Niesic is to be revictualled by the Montenegrins.

The French Government has ordered that hereafter the second and third class cars on railroads must in some way be heated in winter.

Several merchants from the interior of Mexico arrived at New Orleans, the 16th inst., and confirm the news of the capture of President Lerdo and the death of Gen. Escobedo, and the capture of the City of Mexico by Gen. Diaz. Iglesias from Leon, ordered Dias to hold the City of Mexico, and proclaim the Presidency of Iglesias, which Diaz declined to do unless he could name four members of the Cabinet. This was refused by Iglesias, when Diaz proclaimed himself provisional President, and the revolution now continues between these rival pretenders, who are now preparing for a new struggle.

It snowed lately in Constantinople, and the superstitious Turks were filled with dismal forebodings at a phenomenon of such rare occurrence in their climate.

The Duchesse of Edinburgh's daughter has been named Victoria.

The Marquis of San Carlos will, it is said, bring into the Spanish Congress a bill to abolish bull-fights.

The political situation is somewhat clouded again in France in consequence of the development of hostility on the part of the Clericalists and the Gambetta Radicals to the new Cabinet. A conflict between the Senate and the Chamber of Deputies also excites apprehension. The *Republique Francaise* declares the Chamber will know, if occasion requires, how to remind M. Simon of his promises.

In consequence of the refusal of the Basque Provinces to pay the sum of 18,500,000 reals demanded from them for the maintenance of the army of occupation, the treasury of the Provincial Deputation was seized by Gen. Quesada's orders, when it was found to be empty. The resignation of the deputation and municipal council is probable. Troops have been dispatched. Great excitement prevails.

The famine in India is worse than was anticipated.

There is a revolution in progress in Columbia.

Gen. Diaz, the Mexican revolutionist is in complete control of the government.

The latest war news; including advices to Dec. 18, state that Servia has signified her willingness to make proper reparation for the recent insult to the Austrian flag in the forcible detention and searching of an Austrian mail steamer by the Servian police.

A special dispatch from Berlin to the Standard says: Despite all peaceful statements elsewhere the news received from the conference in high political quarters here, maintain that a Russo-Turkish war is inevitable. Russia has not yet completed her preparations, and will endeavor to protract the conference until her southern army is concentrated. Private intelligence from St. Petersburg also states that Russia is unalterably determined to meet immediately the grievances which have been already indulged too long for European peace, but she will not enter the field until she feels able to make an irresistible assault.

The Vienna correspondent of the Times says the Russian General, Nikitine, has started for Servia to take command of the Russian troops there and act as Russian plenipotentiary. The soldiers belonging to the active army of Servia, who are estimated to number 66,000, have been ordered to rejoin their colors by the 22d of December. The Times' dispatch from Berlin states that Gen. Nikitine goes to inspect the Servian army. Russian journals say only 8,000 Russian volunteers remain in Servia. Nearly all the South Russian telegraphs are so damaged by frost as to be useless.

The Standard's telegram from Pesth says it is asserted positively that the Porte will absolutely refuse to cede any territory to Montenegro or Servia.

Achmet Eyoub Pasha has been appointed commander of the Army of the Danube.

Very earnest efforts are being made in England to abate the drunkenness so dreadfully prevalent by the establishment of comfortable eating houses, where intoxicating drink is served only at meals. Dr. Haweis, an eminent clergyman, points out that the discomfort and bad food of the dining rooms drive people to the gin shops. While the former are dingy and dreary, the latter are just the reverse, so the young workmen gulp down their unpalatable food, and then go for the glass which inebriates. Mr. Rathbone, the philanthropic member for Liverpool, stated recently at a meeting in that city that during the previous week the British Workman Public House Company had sold 7,388 gallons of tea, cocoa, and coffee in 75,000 portions, and the takings were £469 5s. 9d. The object of the company is to give all the comforts of the public house without its temptations. In proof of the gains of public houses, he mentioned that $50,000 was offered for the lease and good will of one opposite the Liverpool Sailors' Home.

Dr. Schliemann has made some more discoveries at Mycenæ. In the tomb previously explored he has found a great quantity of women's jewelry in gold, and handsomely worked. Immediately after commencing excavations at an adjoining tomb a large head of a cow in silver, with immense horns of pure gold, was found. A large girdle of gold, five gold vases, and immense golden buttons were also found. All these objects are said to be marvelously worked. Among other discoveries are nine silver vases and numerous swords of bronze, but no trace of ironwork.

An International Retrospective Exhibition of Curiosities of all kinds, from instruments of prehistoric times to objects of art up to the year 1800 will be specially held at the Paris Exposition of 1878. An Archæological Committee has been instituted for that purpose, under the direction of M. de Longperier, of the Institute. The collectors of the world are invited to participate in the interesting enterprise.

SEMI-BUSINESS PARAGRAPHS.

FRANK MILLER'S LEATHER PRESERVATIVE and Water Proof Blacking received the highest and only award at the Centennial Exhibition.

THE RURAL NEW-YORKER wants good local agents. Address RURAL PUB. CO., 78 Duane St.

FRANK MILLER'S HARNESS OIL received the highest and only award at the Centennial Exhibiton.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Dec. 16, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls.	75,801	Molasses	7,913
Whisky	2,123	Rice, bbls.	970
Corn meal, bbls.	2,300	Cut meats, pkgs.	23,716
Corn meal, bags	1,142	Lard, pkgs.	21,881
Wheat, bush.	512,450	Tobacco, hhds.	316
Corn, bush	102,977	do. pkgs	2,694
Oats, bush	101,822	Butter, pkgs	24,114
Rye, bush	48,405	Cheese, bxs	28,197
Malt, bush	9,855	Cotton, bales	35,555
Barley, bush	102,140	Rosin	11,107
Beans, bush	7,000	Sats. turp., bbls.	1,817
Grass seed, bush.	12,130	Dried Fruits, pkgs.	1,417
Beef, pkgs	1,005	Eggs, bbls	3,158
Wool, bales	3,317	Peanuts, bags	1,939
Hops, bales	1,341	Leather, sides	51,998
Pork, bbls	8,111	Sugar, hhds.	1,771
Tallow	1,430	Oil cake	7,916

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival here of summer items on Saturday.

BEANS AND PEAS.—For both mediums and marrows country prices are strong, and, with moderate receipts, quotations here are again pressed upward. There is a pretty steady trade, but sales are restricted, owing to the firmness that all holders exhibit. Other sorts of beans are firm in sympathy with the standards, Pea showing an important advance. Imported and Cal. Limas quoted $3@3.50. The demand for Canadian peas is slack and prices are lower and weak, especially for any under prime.

Exports past week 24,165 bush.; since Jan. 1st, 655,864 do.; same time last year, 159,380. Green peas are steadier since the decline. B. E. peas quiet, but firm. We quote:

Beans—New medium, $2.25@2.30; do. marrow, $2.35@2.40; do. pea, $2.65@2.75; white kidney, $2.50@2.60; red do., $2.30@2.50; Old Beans—Medium, prime, $2.00@2.15; marrow, $1.90@2.25; pea, prime, $2.25@2.45; white kidney, prime, $2.10@2.35; red do., prime, $2.20@2.30; black, $3.00@3.25; Canadian peas, ₩ bbl., free, $1.05@1.01½; do. bulk, 82@91c.; green do., new, $1.15@1.25; do., S. B. E. peas (2-bush. bag), $2.15@2.20.

BROOM CORN.—Demand is unimportant, and prices unsettled.

Brush short green quoted at 7@8c. ₩ lb.; hurl green at 6½@7½c.; green medium at 5@5c.; red and red-tipped, 3@4c.

BUTTER.—We look for a moderate trade just before the holidays, but there has been such a lack of general business this season up to date, that we perhaps feel the present inactivity more sensibly than we otherwise would. The chief inquiry is for fancy stock both Western and State. Under grades of State are neglected. The holding price of it sends close buyers, who now supply the mass of consumers, to the more economically rated Western. The West has been rather luckier in the average quality of butter this year than New York. Speaking of the trouble of moving the good to lower grades of State the Producers' Price Current says:

"This latter class of butter is extremely unsalable; much of it is well made even-colored stock, with the fresh flavor lost and perhaps an old flavor acquired. The offers for it of 23@25c. are generally below holders' views but more than it is really worth in comparison with the Western tubs offering at the same figures. Another grade very hard to sell is late made, wintry butter; it is plenty and is generally sold in lots with better butter, greatly reducing the invoice price. Separately this class of stock could not be made to exceed the rates for Western factory stock, which is, indeed, when well handled, superior to it in nearly all respects."

Pails have become unseasonable, now hardly quotable as a specialty. There is some improvement in fresh rolls and more of the finer qualities could be used. There is a fair packing trade in common Western but not much export demand to be depended upon. Late purchases include some State Welsh tubs. State dairies are unchanged; they have hung on first hands a good while this season.

Exports past week 1,614 pkgs.

We quote:—Creamery, choice, 36@38c.; good, 33@35c.; sweet cream pails, 33@35c. State firkins, choice, 28@30c.; fair to good, 24@27c.; do. half firkin tubs, choice, 33@35c.; fair to prime, 28@32c.; do.; pour and off-flavored, 22@25c.; Welsh tubs, choice, 30@32c.; other, 24@28c.; inferior State, 15@19c.; Western creamery, choice, 32@35c.; other, 32@34c.; do. firkins, best, 21@22c.; other, 15@18c.; dairy tubs, choice, 25@27c.; other, 18@23c.; factory choice, 22@24c.; other, 13@15c.

State dairies quotable at 30@32c. with full tubs Welsh tubs dairies, 2.@29c.

State firkins dairies, 25@30c. Roll butter, fair to prime, 19@23c.; do., poor to fair, 14@19c.

CHEESE.—The arrivals have now become very moderate, and a good portion are for shipment abroad direct. It is thought that the supplies in this market are more largely forward than usual at this season. Exporters have bought fancy colored factories at 13 and white at 13½c., September made. Firm prices prevail generally. We quote:

Fancy factory at 15c. for fancy colored, 14½c. for fancy white; job lots, 15½c.; good and prime, 13½@14½c.; fair, 11@12½c. State farm dairy, fancy, 13½@14c.; good to prime, 12½@13½c.; fair and good, 11@12½c.; common, 5@8c. Western factory, fancy, 14@14½c.; good and prime, 12½@13½c.; fair lots, 10@11c.; factory, State and skims, 3@4c.; do. late, 8@10c.

Exports past week, 16,433 boxes. Liverpool cable quotation, 68s., which is lower. Gold closed at 107¼.

COTTON.—There has been a depressed and dull market. The latest quotations are:

December, 12 3-16c.; January, 12 9-32@12 5-16c.; February, 12 17-32c.; March, 12 23-32@12¾c.; April, 12 29-32@12 15-16c.; May, 13 1-16@13 3-32c.; June, 13 7-32c.; July, 13 5/8@13 13-32c.; August, 13 15-32c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*

Fair	13⅜	13⅜	14	14

Stained

Good ordinary	10	Low middling	11
Strict ordinary	10⅝	Middling	11⅝

DRIED FRUITS.—For apples there has been a more active inquiry for strictly prime lots of State and Western quarters, and steadier prices are made; Sliced apples are very dull. Peaches are yet very scarce and favor the seller. Blackberries and raspberries are hard to sell.

Apples—State, sliced, 5¼@5½c.; do., quarters, 5¼@5½c.; southern sliced, new, fair, 4½@5c.; choice do. 5¼@6c.; fancy, nominal; do., new qrs., in bags, 3½@4c.; do. repacked, 4½@5c.; Western quarters 4½@5c. Blackberries at 8½@8¾c. Peeled peaches, at 20@21c.; for fancy North Carolina; 18@20c. for prime: 18@19c. for prime Georgia; 15@17c. for good; unpeeled peaches, halves, 9@10c.; do. quarters, 8½@9c. Raspberries, 28@29c. Cherries, 17½c.

EGGS.—Dealers ought to look for better prices, with cold weather and light receipts. Trade, however, is irregular, and buyers who will pay extreme rates are few, and they insist on strictly prime condition. Much of the Western stock here and arriving has been held, and when the lower price is named, buyers at once become suspicious. Very few near points are arriving. The South is sending some good, small lots of fresh laid. Limed eggs are dull, quality is against them this season. Last year they turned out finely and the disparity now works against them. We quote:

Jersey, single barrels, strictly fresh, 33@35; State and Penn., 28@30½c.; Western, fresh laid, 26c.; Western & Canadian, fair marks, 28@28½; Southern, fresh laid, 28½@29; State limed, 20@22c.; Western, do., 18@19c.

ESSENTIAL OILS.—The following are the current rates:

Peppermint, $2.50 ₩ lb. in tin, $3.25@3.50 in glass—tone firm. Sassafras scarce and firm at 50c. ₩ lb. Wintergreen, large supply, weak at $2.50. Spearmint, nominally $2.50 ₩ lb.; no demand.

FLOUR.—There has been a very dull market. The advices from the other side have been very unsatisfactory. Export trade has been checked, and the home demand is of a very meagre description. Prices are a trifle easier only.

The latest sales are $5.10@5.35 for poor to very choice superfine State; $5.45@5.60 for very common to fair extra do.; $5.65@5.70 for good extra do $5.75@5.90 for fancy do., and $5.95@7 for fancy to very choice extra; $5.00@5.25 for superfine Michigan, Indiana, Iowa, &c.; $5.45@5.65 for shipping extra do., the inside price for inferior, and $5.70@5.75 for choice to very fancy extra do.; common to choice white wheat extras, $5.80@7.00; fancy do. $7.05@8; winter wheat, good to choice family, $5.25@5.25; round-hoop Ohio, $5.45@5.10, and trade brands of do. at $5.60@7; St. Louis, $5.50@6.70 for common to fair extra, and $6.75@8.25 for good to very choice; Minnesota "straight" at $6.65@7.35, and patent at $7.50@9.00; unsound stock at from $3.75@5.50; city mill extra for West Indies at $6.20@6.30; do. English brands, $5.50@5.60; do. trade and family, $7.00@8.50; No. 2 at $4.00@4.40; sour, $3.75@5.50.

FRESH FRUITS.—Exports of apples past week, 7,511 bbls.; since Jan. 1st 143,000 bs. have been sent abroad. The apple market begins to feel the large outlet that has favored the crop this season. Still there is an abundance, and a good many lots will have to be put at low prices for some time. Fancy fruit in a small way bring $2. Lady apples are plenty and have an unusual low range. There is a fair demand for cranberries.

Our quotations for Jersey berries are for standard packages branded "N. J. C. G. A.," the dimensions being for crates 8¾x12x22 inches and for barrels, diameter of head 16¼, of bilge 13¾, and depth 25¾ inches, inside measurement. California Winter pears are selling slowly at $3@3.50 ₩ box. A few extra W. Nells $4. Cal. Quinces dull at $3 ₩ box.

Grapes firm. Hickory nuts have declined, demand fair. Peanuts dull.

Apples, State, ₩ bbl., prime red, $1.65@1.75; mixed, $1.25@1.50; good to fair, $1@1.25. Lady apples $5@7. Cranberries, crates, $2.50@3.00; Eastern, bbls., good to prime, $8@10; N. J. $8@9, for good to prime. Grapes—Catawba, ₩ lb., 10@12c. Peanuts—Va., fancy, $1.5@1.20; other, 70c.@$1. Hickory nuts, coarse, 50@60c.; shellbarks, $1.50@1.75.

GRAIN.—For wheat the past week has been the dullest known here for a long time. Exporters have been practically out of the market, while the home trade is small, on account of the dragging market for flours. Prices have been very much unsettled; latest sales are of No. 1 Minnesota spring at $1.37. No. 2 Chicago spring at $1.30; No. 2 Milwaukee spring at $1.32. Buckwheat quoted at 80@85c. Rye is lower: Western quoted at 90@93c.; Jersey, State and Pennsylvania, 91@93c. Barley is depressed; No. 1 Canada quoted at $1.10@1.12½. Canada West malt sold at $1.20@1.25, time. Corn is fairly active and strong; mixed Western at 56@56c. Oats are in very good demand and favor the seller: mixed Western and State at 34@49c., and white do. at 38@51c.

HAY AND STRAW.—Supplies have fallen off, and the demand is sufficient to strengthen prices.

Bale hay 150c. for shipping; 70@90c. for retail qualities; clover, 55@65c.; salt do., 50@60c. Straw quoted at 70@80c. for long rye; 50@60c. for short rye, and 45@55c. for oat.

Dealers do not look for any rapid advance as the back countries are reported with a good surplus to make up any deficiency of river crops.

Exports past week, 1,038 bales., since Jan. 1st, 40,569 do.; same time last year, 40,902 do.

HOPS.—There is no marked change. A trifle steadier feeling prevails on the better grades, with a little better trade; The exports for the week are 1,020 bales, and since Sept. 1st, 15,558 bales, against 17,451 bales same time last year; 50c. is made on strictly prime lots Low and medium grades are but little wanted.

New Yorks, good to choice, new	25 to 30
New Yorks, low to fair, new	15 to 25
Eastern, new	20 to 25
Wisconsin, new	12 to 22
Yearlings	10 to 15
Olds, all growths	4 to 8
California, new	28 to 30
Oregon	28 to 30

POULTRY AND GAME.—If anything could keep back live poultry, the following low quotations should have an effect. Quotations include Canadian ducks and geese.

New Jersey turkeys, 8@10c. ₩ lb.; Western, 8@9c.; N. J. fowls and chicks, 8@9c.; Western, 8c.; roosters, 5@6c. Geese, N. J., ₩ pair, $1.50@2; Western, $1.25@1.50. Ducks, N. J., ₩ pair, 75@$1; Western, 50@65c. Live pigeons, ₩ pair, 25c.

The dressed poultry trade has been in a sad condition all the week. Even with the best weather, trade has been very dull and prices have not paid for shipping. In fact, near points have stopped sending, but there is enough Western arriving and on hand to overstock the market.

Turkeys, N. J., 10@13c.; State, 9@12c.; Western, 8@12c. Chickens, dry-picked, 10@13c. N. J. chicks, 9@12c.; State, 8@10c.; Western, 7@10c. Ducks, N. J., 10@13c.; State, 9@12c.; Western, 8@11c. Geese, 5@8c. for common; 10@12c. for good to best.

Game is in good supply and shows more winter activity. Prices regarded good for the times, especially as the stock is large enough to require general trade.

We quote.—Canvas-back ducks $1.00@1.75; Red Head, 35@75c.; Mallard 60@70c.; Teal, 50@60c.; common, 25@30c.

Quail, ₩ doz., prime, $1.25@1.50; soft shell, 60c.@$1, Partridge, 65@75c.; drawn, 40@50c. Prairie Hens, 90c.@$1; drawn, 40@80c. Hares, 30@40c.; Rabbits, 20@30c. Venison, whole, 10@12c.; long saddle, 12@14c.; short do., 15@16c.

PROVISIONS.—Hog products generally are higher and fairly active; mess pork quoted at $16.75 on spot, $16.85 for February, and $17.30 for March. Dressed hogs, Western, at 7@7¾c. Bacon at 9c. for long clear and 9¾c. for short clear. Lard, Western steam, at $10.50 for spot and December, $10.55 for January, and $10.70 for February. Stearine at 10¾c. for prime Western. Tallow at 8¾@8¾c. for prime, in hhds. Beef hams at $20 for choice Western. Beef at $10.50@11 for plain mess, $12@12.50 for extra mess, $20@21 for prime mess, and $22@24 for India mess.

TOBACCO.—Export demand is very light at present, but prices steady.

VEGETABLES.—Exports of potatoes last week, 6,227 bbls.; of onions, 433 do. Potatoes have ruled firm; but, at the close, with a better offering of good Nova Scotia, Peach Blows and Rose, are a shade in buyers' favor. Sweet are higher—not many wanted. Onions higher. Other items steady at prices. We quote:

Potatoes—Peach Blows ₩ bbl. $3.50@3.75. Early Rose, prime, $3.50@3.75; Peerless and Jackson white, $2.62@3 sweet, Del. $3.00@4; Va. $2.75@3. Cabbages, ₩ 100, $5@8. Marrow squash, ₩ bbl., $1@1.25. Hubbard Squash $1.50@1.75. New Russian turnips, ₩ bush., 75c.@—. Onions—Yellow, ₩ bbl., $1.87@2.12; white, $2.75@3.25; red, $1.87@2.12.

WOOL.—There has been a more active market, demand partly on speculative account, and the prices throughout were very strong. XX Ohio fleeces sold at 48c. We quote:

ROCHESTER, Dec. 16.—Flour market strong spring, $7.00; amber winter, $7.25; white winter, $7.50; double extra, $8.00. Rye flour quiet at $5.00. Wheat steady: Milwaukee club, $1.30@1.40; amber winter, $1.25@1.28; white winter, $1.25@1.33. Oats, nominal at 38@40c. Corn quiet at 58@62c. Corn meal, $1.25@1.50. Butter, 24@26c. Cheese, 12½@14c. Eggs, 23@25c. Lard, 10½@11c. Apples, bu., 30@40c. Potatoes, bu., $1@1.20. Beans, ₩ bu., 1.40@$1.85. Mess pork, $17.00. Wool, 25@30c. Hay, $10@12. Straw, $5@8. Timothy seed, $2.75@3.50; clover, $9.25@10. Mill feed firm at $14 for shorts, $16 for shipstuffs, and $20 for middlings. Railroad Freights—Flour to Boston, 35c. ₩ bbl.; to New York, 25c.; to Albany, 20c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Dec. 16, 1876.

THE market has been very thinly attended this week and the delivery of cheese light. The weather is extremely cold and unfavorable for the shipment of cheese. We quote sales of farm dairies at 11¾@12½c. for late ends, mostly Novembers. Only a few lots of factory cheese were sold. The highest rates paid for Novembers, with a light sprinkling of Octobers, were for a lot of Arnold Bros.', which brought 13½c. We quote lowest price at 12¾c.; highest, 13½c.; average, 13¼c.

The delivery of butter has declined in quality and prices are lower. The butter now coming forward is mostly hay-made, and good to fair lots brought from 25 to 27c., while extra went at 28c. Grass butter is scarce, and none has been offered this week.

Cows are reported to be wintering well, and we hear of no cases of abortion—a disease which has been more or less prevalent in Central New York at this season for a number of years past.

We have advices from abroad to the 28th of November. Our London correspondent says the finest English cheese is scarce and medium barely salable. The stocks of American cheese are very small. Septembers are scarce, and the tendency of the market is strongly upward. Prices are as follows:

American, extra fine, 70@72s.; fine, 68@70s.; good, 56@64s.; secondary and low grades, 30@50s. English cheddar brings from 82@98s.; Wiltshire double, 68@70s.; Cheshire medium, 48@54s.; fine, 70@72s.; Scotch, 68@70s. Dutch Cheese—Edams, 56@58s.; Gondas, 58@62s.; Derby shape, 60@64s.

Butter is slow of sale. Normandy and all secondary sorts of European and American are down. The best descriptions of Carlows are firm, and are now taken by biscuit-makers and retailers in preference to Normandy, most of which come loaded with water. We quote:

Choicest, 165@168s.; Corks, 149@159s.; Dorsets, 174s.; Jersey, 130s.; Danish and Swedish, 128@166s.; Normandy, 120@152s. Oleomargarine, 90@104s.

LIVE STOCK MARKETS.

NEW YORK, Dec. 16, 1876.

RECEIPTS OF LIVE STOCK.

Totals this week	10,736	150	1,137	34,531	31,294
" last week	11,450	116	1,141	26,260	33,078

BEEVES.—Trade on Monday last was fair, owing to there having been a moderate run of horned cattle only on hand. A large proportion of the herds shipped did not arrive, being held back by a severe snow storm; prices were 7@11¾c. ₩ lb.; weights, 1¼@11 cwt.; the markets closed firm. Wednesday, trade very slow on a light run; prices 7@10c. ₩ lb.; weights, 1¼@9 cwt. Thursday, trade dull at 7@10½c. weights, 1¾@8 cwt. Friday, trade fair at 7@11½c.; weights, 5@10½ cwt. The markets closed firm. No Spanish cattle to hand, save a very few head mixed in with other herds. Native steers, 7¾@10c.; grade, 10¾@11¼c. Dry cows, 7@8½c. Heifers, 7¾@8¾c. One choice quality State heifer, fatted in Duchess Co., live weight, 1,700 lbs., sold at 11c., to dress 50 lbs. net. Oxen at 7@10c. Mixed herds, 8@9c. ₩ lb. Bulls, live weight, 3¾@3¾c. From 51@60 lbs. net, has been allowed. The quality of these herds, as above quoted, was from poor to fair, with a choice top.

MILCH COWS.—Although the supply of fresh cows has been heavy again this week, trade has been slow; at low rates. Twenty-two cows sold at $30@35 ₩ head 20 cows at $40@45; 16 cows at $45@55; 16 cows at 50@70 3 cows for $120—calves always included.

VEALS AND CALVES.—Smooth quality veals in moderate demand on a light run; prices 8½@10¾c. ₩ lb.; general sales, 9@9¾c. Coarse quality calves very slow of sale at 5@6c., also at $6.25@15.50 ₩ head. Yearling bulls, $12 ₩ head; do. heifers, $13 ₩ head.

SHEEP AND LAMBS.—Trade has been slow in ordinary quality flocks; but the demand for good quality sheep has been steady. Monday, sheep sold at $5.75@6.80 ₩ cwt.; lambs, 6@7c. ₩ lb. Wednesday, sheep, 4@8¼c.; lambs, 5½@6¾c. Thursday, sheep, 4¾@7½c.; lambs, 6¾@7¾c. Friday, sheep, 3¾@7¾c.; lambs, 6@7½c. The markets closed dull. Jersey sheep, 4½@5c.; State, bucks included, 3¾@7½c.; Ohio, 4¾@6¾c.; Missouri, 4¾c.; Kentucky, 7¾@8¾. Jersey ewes, 4½@4½c. Illinois sheep, 1¾@4½c.; Canada, 6¾@7c. State lambs, 6@6½c.; Canada, 6¾@7c.

HOGS.—Monday last, 180 Ohio hogs, average live weight, 190@195 lbs. ₩ head, sold at 6¾c. ₩ lb. Thursday and Friday, nine carloads held on sale. Trade in city dressed dull at 7½@7¾c. ₩ lb., with general sales at 7¾c. Light pigs, selected quality, 8@8¾c.

HORSE MARKET.—The end of this year is now so close at hand that trade in city horses has fallen off until quotations have become so few that they are valueless. Dealers have their stables well supplied and are hopeful of an improved condition of trade early in the coming year. Thirty horses arrived at Erie Railway.

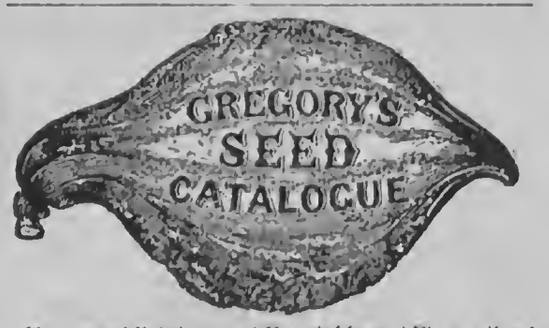
For sale by all Booksellers. Sent, post-paid, on receipt of price by the Publishers,

JAMES R. OSGOOD & CO., Boston.



My annual Catalogue of Vegetable and Flower Seed for 1877 will be ready by January, and sent FREE to all who apply. Customers of last season need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed house in America, a large portion of which were grown on my six seed farms. *Printed directions for cultivation on every package.* All seed sold from my establishment warranted to be both fresh and true to name; so far, that should it prove otherwise I will refill the order gratis. As the original introducer of the Hubbard and Marblehead Squashes, the Marblehead Cabbages, and a score of other new vegetables, I invite the patronage of *all who are anxious to have their seed fresh, true, and of the very best strain.* New Vegetables a specialty.

JAMES J. H. GREGORY, Marblehead, Mass.

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer.*

It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.

PUBLISHERS are not responsible for the safe delivery of their papers to subscribers, still they usually hold themselves in readiness to supply any number of their papor which may miscarry in the malls.

M. B. P.—We will endeavor soon to comply with your request, and again tell our readers how to catch, mount, preserve and pack insects to be sent by mail or otherwise.

T. C. D.—In the Northern States cellars are mainly used by farmers for keeping their apples through winter; but we should think that a light, airy room would answer the purpose in the South. As for the cost of erecting a fruit-canning establishment, much would depend upon the size and capacity; besides, the cost of materials in different localities would vary greatly. An establishment of this kind should be located in a region where other fruits besides peaches could be canned in this season, also various kinds of vegetables, for the same apparatus may be used for all without additional cost.

T. M. B., Rushford, N. Y.—We presume the plant to which you refer is Comfroy, but a root of it would enable us to decide positively.

Reader.—At present we do not know the address of any party engaged in raising minks, or of any one having them for sale.

Mrs. G. J. G.—We have before known instances of excellent singers among canaries losing their notes after molting. If any of our readers can prescribe treatment in such cases, we will be most happy to publish it for the benefit of yourself and others.

J. G.—There are several species of "Grain Weevil," therefore we cannot attempt to name the one infesting your barn without seeing a specimen.

A Subscriber.—Farms in Virginia are said to be selling at a very low figure, but we cannot say whether those advertised are cheap or not. The best course for you to pursue would be to visit the State and make your own selections and bargains on the spot. With cash in hand, good bargains can be made almost anywhere in these times.

S. B.—The Century Plant (*Agave Americana*) will stand a few degrees of frost. It may be placed in sand for the winter, or the roots may be crowded into any pot or box large enough to hold them. It will not need water, or indeed the least care of any kind, so that it be kept from freezing.

S.—Eggs contain a small quantity of sulphur, which, upon being boiled, is converted into sulphurated hydrogen. This gas tarnishes both silver and gold. Hence the teaspoons are tarnished from contact with boiled eggs.

Reader.—The Mimulus is pretty for the greenhouse, but, except for moist, shady situations, it is worthless out-of-doors. We are aware that it is praised as a bedding plant.

C. C.—It is now too late to plant bulbs of Gladioli for winter blooming. They would not bloom before the first of April.

Z., Baltimore.—The lungs of animals are called Lights because they are light. The trachea, or windpipe, and bronchiæ are aptly compared to an inverted shrub, the trachea forming the stem, the bronchiæ (bronchial tubes), the branches, the subdivisions to the tings and the air vessels to buds. These air vessels penetrate to every part of the lungs, and the air they contain makes them lighter than water. Hence the common name of Lights.

R. H.—I send you Pelargonium flowers and tricolor leaves raised from the seeds received from you last year. Is not the flower superior to others and worth placing in the hands of florists? ANS.—We should say not. The flowers are not of an unusual shade, so far as can be judged, and as to size, we have a number, raised from the same lot of seeds, as large, or larger, that we have thrown away. We think florists would act wisely to follow our example as regards two-thirds of the Pelargoniums with which their catalogues are crowded. The tricolor leaves are pretty, but resemble the Mine. Pollock section so closely that, unless the plant is peculiar in habit or vigor or endurance of sun, it would not be considered as worthy of being preserved under a new name.

Traveler's Guide.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTHWESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to
MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

MOORE'S RURAL NEW-YORKER is one of the readable, useful, family papers, equally in demand by the lady in her conservatory, the matron with her household, the farmer in his field, the stock raiser among his animals, and the young folks around the evening lamp.—*Lewis of Life.*

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper* and in Premiums to Agents.

PERSONAL ITEMS.

WADE HAMPTON is fifty-five.

ROSE EYTINGE is in sooty Cincinnati.

AN Italian invented spectacles in 1248.

YOUNG ladies still wear pie pans on their belts.

MAKAY of the big Bonanza, has a chateau near Paris.

GOVERNOR FAIRBANKS is said to be out of danger.

EMPRESS ELIZABETH of Austria had an early love for emeralds.

THE sixth boy born to a Wisconsin couple is named "Enough."

LYDIA MARIA CHILD, the authoress, is seventy-five, and still healthy.

FARM laborers in California receive from $25 to $50 a month, with board.

IT has been ascertained that there are 250,000 species of living animals.

NINE hundred million pounds of copper is the amount of last year's crop.

THE principal cities of the Union are fighting for gas at $1.50 per thousand.

THERE are 12,000 parish priests in France whose salary is only $180 each a year.

THE boys who help make nice falling places on the sidewalks are busy just now.

THE son of the late President Tyler is a professor at William and Mary College.

SENATORS Conklin and Blaine have not spoken to each other for over three years.

DEADWOOD, in the Black Hills, has been hitched to civilization by the telegraph wire.

GEORGE ELIOT gets homelier as she grows older, while Lewes improves in appearance.

THE giant Ferragus, slain by Orlando, nephew of Charlemagne, was eighteen feet high.

A MISSOURI man has bull-dozed an opera. He has 200 acres devoted to a bull-frog farm.

RICHARD GRANT WHITE is back from Europe. He seems to be enjoying his usual accuracy.

UP in Norway men arrested for being drunk are made to sweep the streets until they are sober.

THE San Francisco Post, in the course of a long descriptive article, says that oysters have no feet.

A YOUNG lady whose senses become intoxicated with the odor of flowers, gets drunk on a 5-cent. Cheap!

CARDINAL SIMEONI has taken the oath of allegiance to the Pope and becomes the successor of Antonelli.

EDWIN BOOTH is fast lining his pockets again. He has just paid $142,500 for a block of buildings in Chicago.

THERE is so much medicine "free of charge" now-a-days, that some people consider it a luxury to be sick.

THE total production of beet root sugar in Europe is now estimated to considerably exceed 1,000,000 tons.

BARRY SULLIVAN'S oldest son, Amory, has just been getting married to the English actress, Miss Adeline Stanhope.

THE obstacles to the marriage of the King of Spain with Duke de Montpensier's daughter have been removed.

FORTY-FIVE thousand old Austrian Wentzel muskets have been bought by the Russian Government and shipped to Russia.

MEIN HERR, do you know for what we calls our boy Hans?" "Vell, I'll tell you; der reason we call our boy Hans—dot ish his name."

TROY has a young lady so conscientious that she refuses to play on any but an upright piano. She has the legs enveloped in leather.

SOME man afraid of monarchism wants to know what shall be the name of the Emperor of New Jersey. How would Apple Jack I. do?

EDWARD FOX of Titusville, Pa., has recovered $93,000 damages from the Baltimore and Ohio Railroad by a twenty-three years' suit.

ROSS R. WINANS of Newport, has purchased the sloop yacht Arrow, said to be the fastest sloop in the world. The price paid was $9,000.

THEY are eating strawberries in Southern Carolina. This news makes a man "bless" Arctic rubbers and molasses taffy parties.

THE Empress of Germany often appears in public robed in a simple calico dress. She discourages extravagance in dress among the ladies.

JOHN BROUGHAM, speaking the other day of the great Macready, said:—"His voice was like broken china clinking in the bottom of a dry well."

ROCHESTER DEMOCRAT:—"Lucy Hamilton Hooper says the average American husband is a niggard. Would you have your daughter marry a niggard?"

ANOTHER departure of justice. During the tempest of last Saturday a basswood image of justice was blown from the court house in Adrian, Michigan.

M. HENRI CERNUSCHI, once a wealthy opponent of Napoleon, has sailed for America, where he will argue in favor of making the silver dollar equal to the gold.

FROM PUNCH:—"Elder Sister (wishing to show off her small brother's accomplishments)—'Now, Jack, who was the first man?' Jack—'Adam!' Elder Sister—'Quite right! And where did he live?' Jack (who has notions of his own about earthly paradise)—'In the Z'logical Gardens!'"

RUSSIANS hate Germany, and fear her; hate Austria, and despise her; and neither despise nor hate England, but feel called on by destiny to go to war with her.

AT the recent marriage of Mlle. Weisweiller, the Baroness Therese de Rothschild wore a white pardessus, embroidered in gold, cut in the style of a manteau de visite.

THE old Richmond Enquirer, after a suspension of ten weeks, has made its appearance again. J. L. Schoolcraft is proprietor, O. Watson James, editor, and W. B. Allegre, business manager.

THE dogs of the Dartmouth students have become so regular in their attendance at chapel prayers that the President has announced that either they or their owners must leave college.

IN the many matrimonial reunions in Paris among *la mode elegante* recently, toilets have not been a little remarked which combine with dark silks a mixture of cashmere or plain China crepe.

HENRY MEIGGS, formerly a great San Francisco speculator, and now a railway capitalist in Chili, is sixty-five years old. He was born at Catskill, on the Hudson. He is said to be worth $200,000,000.

THE London Spectator, republishes Mr. Ross' story of his lost boy, and after a comment, concludes that there is every reason to justify the belief that the boy is dead—"that he was dead from the first."

THE solemnity of a funeral at Macksville, (Ark.) was disturbed by a fight between the grave-diggers. Pistols were used, and when the misunderstanding was settled, two more graves were necessary.

THE clay model of the statue of Juarez, which has been ordered from Mr. Gagliardi of San Francisco by the Mexican Government, has just been completed. The statue is to be cast in bronze and placed in Mazatlan.

ELIZUR WRIGHT of Medford, Massachusetts, the insurance man, lost his barn, with its contents, by fire the other night, and it was not insured. Loss, $6,000. So much for giving his own most excellent precepts the go-by.

HELMHOLD, the insane druggist, leaks out of the asylum like so much quicksilver. He has escaped again. His wife obtained a divorce a few days since and the doctor (?) prepared for a jollification at Delmonico's in New York.

DR. LEGGE, the professor of Chinese at Oxford, has given two lectures, the second lecture being distinguished by the presence of the two Chinese Commissioners sent by the Peking Government to the Exhibition at Philadelphia.

MR. GLADSTONE uses postal cards. No matter what the subject upon which a correspondent writes to him the ex-Premier sends a few lines upon a half-penny card, which, a few days afterward, duly appear in the newspapers.

BARON UXKULL, the Russian ambassador at Rome, has surprised society by appearing with a chasseur in full fig, with pointed hat and white cockade, reviving an old privilege accorded only to Roman princes and ambassadors near the Pope.

VISCOUNT STRATFORD DE REDCLIFFE, the great diplomate of England, who, before the Crimean war, so long kept the Czar Nicholas at bay, has finished his ninetieth year; but, though he has the gout, he takes great interest in European politics.

Trees, Seeds, Plants, &c.

For 10c. each additional, one **Magnificent Premium Rose** to every dollar's worth ordered. Send for our new **GUIDE TO ROSE-CULTURE**, and choose from over **300** finest sorts. Address THE DINGEE & CONARD CO., ROSE-GROWERS, West Grove, Chester Co., Pa.

WANTED. A Nurseryman, with a small capital. Address J. H. BRISTOR, Martinsburg, W. Va.

POMONA NURSERY. MILLIONS OF Trees and Plants. Capt. Jack and Great American, the best Strawberries. Ten acres of *Brandywine* (Susquehco) Raspberries, yielded last summer $1,338. Send for Catalogue. WM. PARRY, Cinnaminson, N. J.

Spring Avenue Gardens.

WINTER-BLOOMING PLANTS

A SPECIALTY.

Carnations, Smilax, Neapolitan Violets, Bouvardias, Chinese Azaleas, Lily of the Valley. All the new and most desirable Geraniums and similar plants. Also, a great variety of the common and fancy Hardy Evergreen Trees, as low as they can be purchased of any trustworthy dealer.

Address H. W. HALES, Ridgewood, Bergen Co., N. J.

New Publications.

THE YOUTH'S COMPANION

A WEEKLY PAPER FOR YOUNG PEOPLE AND THE FAMILY

THE COMPANION aims to be a favorite in every family—looked for eagerly by the young folks, and read with interest by the older. Its purpose is to interest while it amuses; to be judicious, practical, sensible, and to have really permanent worth, while it attracts for the hour.

It is handsomely illustrated, and has for contributors some of the most attractive writers in the country. Among these are:

J. T. Trowbridge,	Louisa M. Alcott,
Edward Eggleston,	J. G. Whittier,
James T. Field,	Louise C. Moulton,
Rebecca H. Davis,	C. A. Stephens,
Mrs. A. H. Leonowens,	Harriet P. Spofford,
Edward Everett Hale,	Julia Ward Howe.

Its reading is adapted to the old and young; is very comprehensive in its character. It gives

Stories of Adventure,	Stories of Home and
Letters of Travel,	School Life,
Editorials upon Current Topics,	Tales, Poetry,
Historical Articles,	Selections for Declamation,
Biograph'l Sketches,	Anecdotes, Puzzles,
Religious Articles,	Facts and Incidents.

Subscription Price, $1.75. Specimen copies sent free. Please mention in what paper you read this advertisement.

PERRY MASON & CO.,
41 Temple Place, Boston, Mass.

GOOD BOOKS. Send for some of these *good, cheap* and *valuable* books: Moulton of Freemasonry, 200 pp., 75c.; Morgan's Masonry Exposed, 75c.; Odd Fellowship Exposed, 25c.; Modern Pocket Hoyle, 400 pp., 50c.; Everlasting Fortune Teller, 150 pp., 30c.; Art and Etiquette of Making Love, 175 pp., 30c.; Granger's Text Book, 150 pp., 40c.; Every Man His Own Doctor, 135 pp., 50c; American Horse Doctor, 100 pp., 25c.; Ladies' Guide to Beauty, 30c.; Guide to Ventriloquism, 20c.; Hunter's Guide and Trapper's Companion, 25c.; Art of Letter Writing, 15c.; Courtship Made Easy, 15c.; Book of Nature, $1. Wit and Humor.

HIS GOOD REASONS.

A MAN who does business on Griswold street was yesterday button-holed at the Post Office by an acquaintance, who observed:—

"They say that you have left the——church and joined the one over on——street."

"Yes, that's so, was the answer.

"Didn't like the preaching, eh?"

"Oh, the preaching was good enough, and the pew rent wasn't too high, but they are a queer set up there. Most any of them will lend a man $10 if he's pinched, but it isn't three days before they come spooking around and want it back. I want to get somewhere where the brethren are more absent-minded, or where they won't walk a mile in a heavy rain without an umbrella to remind me that time's up."

"And you like it?"

"I think I shall. I borrowed $15 of a member nearly three weeks ago, and he hasn't said anything about it yet."—*Free Press.*

SPARKS AND SPLINTERS.

THE young lady who took the gentleman's fancy has returned it with thanks.

THE way for a desolate old bachelor to secure better quarters, is to take a "better half."

Young women should set good examples, for the young men are always following them.

THE kind of a gaiter that we don't hanker after is the alligator; there's too much snap to it.

"Bearup and Carraher" is the name of a firm doing business on Grand-street, near the ferry.

IT took Sir Isaac Newton less than three years to thoroughly digest the principles of gravitation, while a Rhode Island farmer has spent eleven years trying to find out why a cow never kicks till the pail is nearly two-thirds full.

AN old woman who is crossing the street has a narrow escape from being run over by a hearse: "I am not at all superstitious" she says to her rescuer, "but it has always seemed to me that it would be unlucky to be killed by a hearse."

AN old banker casts himself at the feet of a pretty woman, who bursts into laughter.

"Do not mock me," he says: "I will do this whenever fortune secures me an interview."

"But what return do you expect to receive?"

"Six per cent.!"

MARY: "There's such a rude gentleman dining up stairs to-day." Cook: "Why, what d'ye mean? He ain't a bin saying nothing to you?" Mary: "No, bless yer; but missus was a-talking about the akkademy, and if he didn't tell her as he could see she painted, and so she do every night; but he needn't have said so afore people."

A CHARMING and coquettish woman deserts her husband's roof.

"That which most grieves me," he says to a friend, "is that I cannot understand why she should have fled, whether for this reason, or that, or the other."

"Oh," says his friend, "make your mind easy. She has left you for the other."

A BANKER has some doubts as to the genuineness of the signature of a promissionary note that has come into his possession, and sends his clerk to the maker.

"We have a note for 10,000 francs on which is what purports to be your signature. Is it yours?"

"Is the note protested?"

"No, sir."

"Then it is not mine."

"This," said the private secretary to the railroad manager, "is a letter five pages long from the editor of the Bungtown Banner, asking for some statistics and miscellaneous information concerning the road, which he desires to incorporate into an article soon to be published, that cannot fail to be of great interest to his readers, and will possibly be of value to the railroad. The circulation of the Banner is——." "Skip that," said the manager; turn over to the postscript and see how far he wants the pass for."

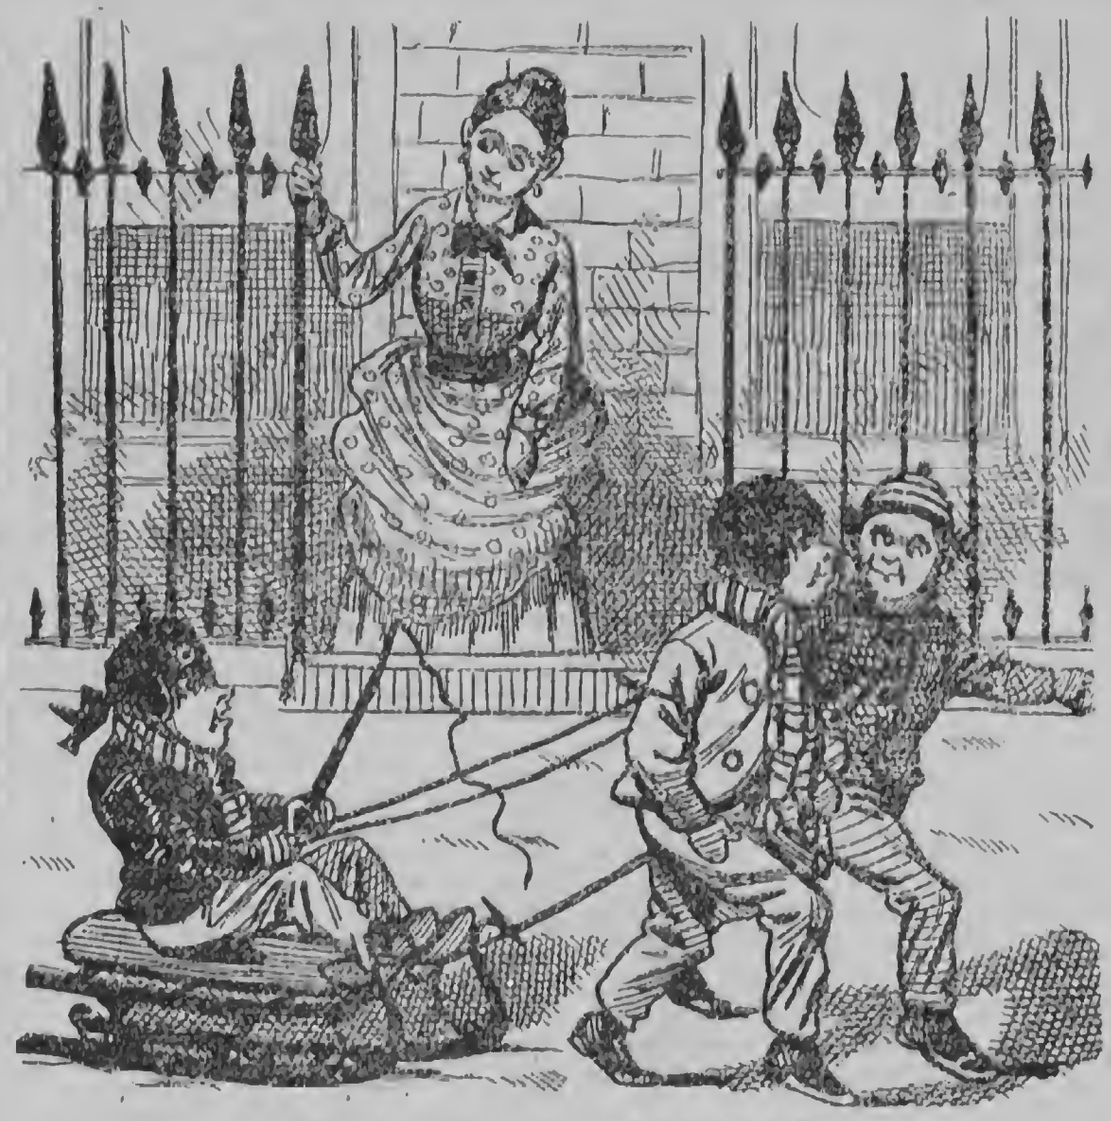
DURING the subscription for the municipal loan in Paris, which was taken so many times over, a long queue of people gathered at the *mairie*, Rue Drouot, anxious to subscribe. Some of them were on the ground all night to obtain good places. Finally, a woman fainted from exhaustion.

"She must be taken home," said an officer, after examining her. "Does any one know where she lives?"

"You bet!" cried a *gamin;* "there's her husband," and he pointed to a man standing in the ranks and regarding the scene without taking any apparent interest in it.

"What?" said the officer, indignantly; "you see your wife in such a state and stir no more than a stone?"

"Stir? Not much! I'd lose my place!"



CRUELTY TO ANIMALS.

MOTHER.—"Come JOHNNY to your dinner, and let the other boys go to theirs. It's so cold, you will freeze."

JOHNNY.—"Yes, Ma; but I must turn my *horses* around and hitch them to the fence until I get through my dinner. I shan't be more than half an hour. (Imagine the feelings of GEORGE and TOMMY, who are also hungry.)

"Dr. Loring has given us a book which is at once cyclopædic in its information, entertaining for its wit and humor, and interesting as a story for the bright thread of real life and love that runs through it."—*Golden Rule.*

THE
FARM-YARD CLUB of JOTHAM

An Account of the Families and Farms of that famous town.

BY GEORGE B. LORING.

With seventy Illustrations by J. W. Champney (Champ), Frank Lathrop, Mrs. Rose Hawthorne-Lathrop, Edwin Forbes, C. A. Barry, and others.

This volume combines the best modern practice and scientific agriculture with a story of New England country life, in such a manner as to make a most interesting book. It is printed on the finest paper, and the designs are beautifully executed, the whole making the handsomest volume on agriculture and country life ever issued from the American press.

One large octavo volume, elegantly bound in fine cloth, with designs on cover in black and gold. $3.50.

Agents wanted to sell this book in every town where there are no bookstores. Sent, post-paid, on receipt of price by

"OH! WHY
Should the Spirit of Mortal be Proud?"

This is a splendid specimen of book work, designed as a Holiday Gift, uniform in size, style and price, with

"NEARER, MY GOD, TO THEE,"

The daintiest Holiday Book of last year.

OH! WHY SHOULD THE SPIRIT OF MORTAL BE PROUD?

"It has an illustration, in the best style of the Art, with each verse of the poem. The verses might ere this have been forgotten were they not inperishably associated with the memory of a great man, and interwoven with the history of his greatest sorrow. The first love and affianced bride of our martyred President, Abraham Lincoln, died in the bloom of youth; and from that time he was often heard to repeat those wonderfully sad and impressive lines, expressive of the grief which lay with continual heaviness on his heart. He frequently repeated them aloud to his companions, even as late as his Presidency. We learn from the poet Bryant, in his Library of Poetry and Song, that this poem was a particular favorite of Mr. Lincoln. Mr. F. B. Carpenter, the artist, writes that while engaged in painting his picture at the White House he was alone one evening with the President in his room, when he said, 'There is a poem which has been a great favorite with me for years, which was first shown to me when a young man, by a friend, and which I afterwards saw and cut from a newspaper and learned by heart. I would,' he continued, 'give a great deal to know who wrote it, but have never been able to ascertain.' Either of these exquisite books, so appropriate as a gift from a parent to a child, or a child to a parent, from a brother to a sister, or a sister to a brother, or from one friend to another, may be obtained at the booksstores, or they will be sent, prepaid, at the very moderate price of Two Dollars Each. Will be sent upon application, a copy of their elegantly illustrated catalogue, giving full particulars of all their holiday publications by

MOORE'S RURAL NEW-YORKER.

RURAL AND HOME AFFAIRS. ARTS, SCIENCE, LITERATURE, NEWS, MARKETS, ETC.

VOL. XXXIV. No. 27. WHOLE No. 1465. NEW YORK CITY, DEC. 30, 1876. PRICE SIX CENTS $2.50 PER YEAR.

[Entered according to Act of Congress, in the year 1876, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

Industrial Topics.

EXPERIMENTAL GROUNDS.

There are doubtless many persons among the readers of the Rural New-Yorker who honestly think that the editors and publishers of metropolitan newspapers know little or nothing about matters perlaining to rural affairs. In fact, the term "sidewalk farmers" has become a common term which is applied to those city gentlemen who happen to take sufficient interest in farming to own a place in the country, or even write or talk on agricultural topics. It is doubtless true, however, that the epithet, "sidewalk farmer," is frequently appropriately bestowed upon men who, in their practical experience of cultivating the soil, never came within hoe or plow-handle distance of actual farming, consequently their knowledge of the subject is mainly of a second-hand order.

Having of late received numerous letters of inquiry relating to the personal experience of the editors of the Rural New-Yorker in horticultural and agricultural affairs, we have concluded to answer them by giving a few sketches of the Rural's Experimental Grounds, detailing very briefly what has been and is now being done from which our readers derive a benefit directly or indirectly. Of course, we admit the right of subscribers to be as inquisitive in regard to the practical experience, capabilities and trustworthiness of those who make their "family paper," as they are in selecting a physician to attend them in sickness or health, and we only wish that there was a larger number of persons who took this view of the subject, and scrutinized more closely than they do at present the character of the mental food distributed among their associates.

VIEW IN EXPERIMENTAL GROUNDS.

The accompanying illustration (Figure 1) is a view across one side of lawn looking westward. The group of evergreens in the foreground are mainly Arbor-Vitæs of various varieties and species and all of about the same age—say fifteen years old—but planted only eight years ago. A glance at this group tells a story which could not be so well told in words, were we to fill columns in the describing of the different varieties and species. The small, dense, globular-shaped plants in the front are only three and a half feet high and about the same in diameter, although of the same age as the tall specimen in the center, which is fully fifteen feet high, but the first is a dwarf variety known as the Globose Arbor-Vitæ (*Thuja globosa*) and the latter our common American (*Thuja occidentalis*). There are also in the group Golden Variegated Arbor-Vitæs, Japanese, Chinese, Siberian and several other varieties and species, besides trailing Junipers, Yews, and a unique dwarf variety of the common Hemlock Spruce.

The border at the left is filled with choice kinds of hardy shrubs, among which are *Magnolias*, *Spiræas*, *Euonymus*, *Weigelas*, and what we claim to be one of the largest specimens of that rare and beautiful Chinese shrub, *Exochordia grandiflora* to be found in this country. It is one of the first half dozen imported into this country. But we need not particularize further than to call attention to the handsome specimen of that much-neglected Liquidambar tree planted ten years ago and now thirty or more feet high, and as handsome a tree as one would wish to see. We will remark, in passing, that both this Liquidambar and the beautiful specimen of Hemlock, standing alone in the center of the lawn, were dug up out of the woods, where some persons think really handsome trees cannot be obtained or made to grow and thrive after transplanting.

Various beds of roses and banks of shrubs extend around three sides of the lawn and upon it (not shown in this view) there are many handsome ornamental trees of various sizes, from the small Weeping Birch up to an American Elm which we raised from seed in 1859, and it is now between thirty and forty feet.

Space will not permit us to name a tenth of the number of species, to say nothing of the varieties which are growing in an area of about two acres devoted to lawn and pleasure-ground, but we must stop at a large group of dwarf evergreens long enough to note a hedge-hog Juniper twenty years old, that is less than a foot high and only ten inches in diameter, and yet it is healthy and vigorous for one of its kind. This is one of the little beauties, the chief value of which consists in its littleness. There are also Dwarf and Weeping Spruces, Pines and Hemlocks, all of which are interesting to the student of nature, showing him the possibilities of variations among plants.

THE HEMLOCK HEDGE.

In view No. 2, a Hemlock hedge is shown which is scarcely to be excelled in perfection of form, health or vigor. It is three hundred feet long, five feet broad at the base and six feet high. It was planted eight years since, the soil trenched two feet deep and four feet wide, well enriched, and small plants less than a foot high, set in the center of the prepared space. Not a

Fig. 1.—VIEW IN RURAL EXPERIMENTAL GROUNDS.

plant died the first season or since. Its beauty and vigor we attribute to two things—thorough preparation of the soil before planting (especially the trenching) and the annual pruning in spring. There is certainly no secret in this, and there is no good reason why just such hedges should not be seen upon every farm, the owner of which has an eye for ornaments of this kind. There is certainly no hardy evergreen the equal of Hemlock for ornamental hedges.

NATURE'S ROCK WORK.

View No. 3 gives a glimpse of some rocks and large Chestnut and Oak trees, the latter the remnants of the original forest which was growing upon these grounds a century ago. Luckily for us, about an acre of our ground is too rocky for cultivation, and to this circumstance we are indebted for the preservation of some fifty or more of the noble old specimens which were part of the primeval forest. The few left have their roots deeply imbedded in the crevices of the rocks, where they find sufficient nutriment to keep them alive and but little more, the rocks being a coarse kind of red sandstone which does not, as everybody knows, furnish much plant food in its composition.

The steps leading up to our library and museum are cut out of the solid rock, and by the side of these we have several times attempted to make a fernery; but for the want of an abundance of water to apply artificially, our success has not been at all satisfactory. We have, however, learned by experience that coarse red sandstone is not as good for making rock-work as granite or limestone, for it will absorb moisture very rapidly, requiring almost as much to keep the rocks wet as the soil among them. Honeysuckles and Ivies have grown very well among these rocks, and the Golden Japan spreads over a large rock near the steps (shown in the illustration) where its handsome leaves and fragrant flowers are worthy of the admiration this plant receives by every passer-by in summer.

A FEW WORDS ABOUT FRUITS.

Hastening past the hundreds of species of hardy herbaceous plants, ornamental shrubs scattered here and there about the place, only glancing into a large greenhouse filled with Geraniums, Smilax, and several hundred of the *Abutilon Boule de Neige* loaded with the snow-white flower, we hurry along to the fruit garden, passing a square containing several thousand young evergreens and another filled with seedling Chinese herbaceous Paeonias, among which we hope to get some few sorts worthy of presentation to the subscribers of the RURAL NEW-YORKER a year or two hence.

ABOUT GRAPES.

Between two and three hundred varieties of grapes have been tested here during the past dozen years, and hundreds of dollars paid for specimen vines which, after testing, were dug up and cremated and their ashes returned to the soil for the benefit of their successors. New sorts are procured annually for the same purpose, and it makes no difference to us whether a sort proves good or bad, as our object is to ascertain the fact and publish it for the benefit of the readers of the RURAL NEW-YORKER.

RASPBERRIES.

Fully one hundred varieties of the raspberry have been tested on these grounds and about twenty are now retained for further experiments. The money paid out for new raspberries, at from three to ten dollars per dozen, during the past fifteen years, if now at hand would be sufficient to make ourselves or somebody else a very handsome New Year's present. But the information gained by these experiments is worth all it cost, and enables us to speak positively of things learned by dear-bought experience.

CURRANTS.

Every variety and species of currant at all likely to withstand the rigors of our climate, has been obtained and planted in these GROUNDS and the greater part still remain. We might, and in fact may, tell at some future time the difficulties which beset us in endeavoring to make up our collection of currants. Of course every nurseryman in this country and Europe was positively certain that his stock was genuine and pure; but a practical test of the matter by obtaining plants from various sources, at the same time planting each lot separate and then waiting for them to fruit, gave results which were instructive, and we may add amusing, to the man who could forget the drain upon his purse when making the purchase. In one instance, we received seven distinct sorts, all labeled as one variety. But by ordering the same variety from a dozen different sources, we were frequently enabled to settle a dispute in regard to identity, and this is how we discovered that the *Cherry* and *Versailles* currant is one and the same sort as grown here and all over Europe: but it took us fifteen years to find it out.

BLACKBERRIES.

The Blackberry in all its varieties as found in this country, with those found in Germany and the Blue-berried bramble growing on the dykes of Holland, and one from the Himalayan Mountains, have been fully tested. The last-named sort, however, never seemed to get ready to bloom until time for frosts in autumn, consequently we were less able to decide about its fruit.

Once, and only once, were we really captivated by a blackberry and that was by Wilson's Early, and the story is too good to keep, even if it does not redound to our credit for sagacity. The first time we saw this variety in fruit, it was growing in the grounds of a well-known fruit grower near Philadelphia, and we were so struck with its fine appearance that we engaged a thousand plants on the spot for $600. The next fall the plants arrived and, in the meantime, an acre of land had been prepared in the most thorough manner, not less than two hundred dollars having been expended in the operation and manure purchased. Believing that we were going to show our neighbors what thorough culture would do for the greatest blackberry known, no expense or pains were spared to make the undertaking a success. The plants made a good growth the first season, but not sufficient to give much fruit, so all the canes were cut down and a strong chestnut stake driven to each plant. The second season the growth was very satisfactory and the canes passed the winter uninjured and the prospect of a large crop was very flattering. Canes were all tied up carefully, pruned, and the ground cultivated between the plants so thoroughly, that not a weed was to be seen when the fruit began to ripen. So far, everything was perfectly satisfactory, and even a little later, for in all of our experience, we never saw such large berries or in greater quantities than were produced on these plants; but, alas! everybody else had a great crop and the fruit would not pay the cost of gathering and sending a few miles to market. We feasted and invited our neighbors to do the same, and the next winter the plants were killed to the ground. The spring following the roots were plowed up, put into heaps and burned, except a few reserved for future experiments. Those reserved kill down to the ground almost every winter, hence our frequent advice to correspondents residing in the latitude of this city or northward to let the Wilson blackberry alone.

Want of space forbids the extending of these remarks, or we might tell something of apples, pears, cherries, plums, and various other fruits tested, but enough has already been said to show our readers that we endeavor to obtain and give them trustworthy information, even at the cost of years of labor and the free use of money. We have other views in the RURAL'S EXPERIMENTAL GROUNDS which will follow those in this issue and be accompanied with an account of experiments made in floriculture.

Dairy Husbandry.

DAIRY CONVENTION.

NEW YORK STATE DAIRYMEN'S ASSOCIATION.

ELMIRA, N. Y., Dec. 14, 1876.

"OLD PROBABILITIES" has once more favored us with a fine day; but even the beauty of the weather did not induce the inhabitants of one of the best dairy sections of the State to turn out and attend the Convention. It may be that the farmers of Chemung County know all they desire to learn about this industry, or it may be that the unfortunate gentlemen who were invited to read carefully-prepared papers on this occasion were mere novices in dairying. Whatever was the cause, there was certainly a conspicuous absence of Chemung people in attendance. Should the Association in future give this region the go-by in arranging their annual assemblages, the inhabitants may attribute it to their own disgraceful apathy upon a subject which so nearly concerns the business of their lives. The few gentlemen of Elmira and vicinity who *did* interest themselves in the matter displayed a commendable zeal, but they evidently could not "carry their own district," as the politicians say. The Hall was commodious, the notice of the Convention was ample, and the weather was more than propitious, and yet the people did not come. I can only say that it was their own loss, for they missed much that was instructive and interesting.

SECOND DAY—MORNING SESSION.

Dr. Crafts presided at the opening and began with a paper on "Jerseys" by Mr. Rutherford of Waddington, a gentleman who knows well whereof he speaks, having been a breeder of such stock for years. He is the same gentleman who made such a creditable exhibit of those cattle at the last State Fair in Albany.

This was followed by a paper from James Miller of Penn Yan upon "The Best Cow."

Mr. John M. Peters of the Grocer then read a clear and concise paper on "The Commercial Aspects of Dairying." Having been connected with the New York markets for a number of years, he was enabled to give some very sound advice to producers as to packing, shipping and marketing the products. After finishing his paper, he was subjected to some pretty severe cross-examination by various gentlemen present, during the course of which he happened to remark that it was a matter of frequent complaint that actual tares generally far exceeded the tare-marks on packages of butter. At this, Mr. Van Duzer of Elmira, who is at once an Editor, a Farmer, a Granger, a Dairyman, and lots of other things besides, informed Mr. Peters that he should not make charges against the farmer unless he had the facts and figures to sustain them. Mr. Peters quietly replied that if it would be any consolation to him (Van Duzer) he would state that he did not mean the Van Duzer Creamery when he spoke, but that he had simply repeated to the Convention a complaint made by consignees of dairy products; that he supposed the Convention wished to be told the truth, be the same palatable or otherwise; that if they wished flattery instead, he could in future serve up the dish to suit the taste.

Mr. Van Duzer, finding that he had waked up the wrong passenger, stopped where he was.

The discussion was interrupted by an inquiry from Mr. Stiles as to where the farmers of Chemung were, adding that he was ashamed of the small crowd present. He was corrected by Dr. Crafts, who said he was ashamed of the large crowd absent. This closed the session and an adjournment was had till 2 P. M.

AFTERNOON SESSION.

The first paper was from the pen of Dr. Mott of New York, on "Milk," read by T. D. Curtis. It was scientific and technical, and failed to produce either discussion or enthusiasm.

L. B. Arnold followed with a paper on "Dairy Products at the Centennial," giving a glowing account of the magnificent success of that most stupendous failure of the season. It consisted of very little about the Exhibition and an exhaustive history of what Arnold did on that momentous occasion. It was upon the reading of this paper that the "Centennial Dairy Ring" looked for the general attack. They were on hand in force and prepared for a vigorous defence, but were so severely let alone that they must have felt sadly disappointed and not a little ashamed. The only notice taken of their doings was by Mr. J. S. Holbert of Chemung, who took exception to Mr. Arnold's manner of making awards at the Exhibition, and proved quite conclusively that Arnold had given the award to the poorest butter of the three samples in close competition. Arnold made the old standing and feeble defence that Holbert was a disappointed candidate for honors; but the general opinion seemed to be that there had been "something rotten in Denmark." Arnold was then asked if the N. Y. State cheese exhibited there had been sent by the makers or had been purchased by the Centennial Committee. He did not know; he believed they were *solicited*. Did *solicited* mean *purchased?* He did not know. This singular ignorance on the part of Arnold becomes almost significant when consideration is given to the fact that he slept and lived right in the Exhibition Building with Blanding, the Great Architect; Pope, the Superintendent; Hawley, the—well, really, I don't exactly know what Hawley was at that time, except that he seemed to be one of the bosses of the soup-house. I suppose, however, that Arnold meant to say that he did not purchase any himself, and, therefore, had no personal knowledge of the fact. As Mr. Shull had stated that the cheeses were *purchased*, the question was asked to see how well the Ring had learned their lesson. They can go to the head of their class, I think. They may not, however, get off so easily at the meeting of the American Dairymen's Association.

Mr. Scoville then read the report of the Committee on "Experimental Station," after which a motion was made to relieve this Committee from further arduous labors and appoint a new one. Scoville, however, displayed such anxiety to continue at the head of this Committee that the motion was withdrawn. Judging from the action of this gentleman upon the occasion of the "capture" of the Centennial Committee by the Ring and his subsequent management of that little job, there must be something in this Experimental Station needing attention. Does it portend another "capture?" Will a restaurant be established at the Station? If so, Bro. Hawley's services will be indispensable. I suppose Mr. Blanding will erect the buildings and Mr. Arnold will be Inspector-General, while the genial Harris Lewis will look after the advertising and general newspaper work.

A committee of five was then appointed to revise the Articles of Association.

A committee of three was appointed to collect Dairy Statistics.

A resolution of thanks to the authorities and citizens of Elmira and to the Elmira Farmers' Club was then passed.

The Association was then invited to participate in the Festival of the Farmers' Club this evening, and accepted.

After a resolution of thanks to Mr. Reynolds for the use of the Hall, the Convention adjourned.

The display of dairy products and implements was meager in the extreme. Mr. Hyde exhibited a full set of Hyde Milk-Pans suitable for a 20-cow dairy. These pans were patented last August and are manufactured by the Jewett Milk Pan Co. of Cortland, N. Y. They are substantially the well-known Jewett Pan, with a channel under the center for incoming water, which flows out on either side. It is deserving of a careful trial, and will undoubtedly be a popular pan. Whitman & Burrel of Little Falls, N. Y., displayed the Gardner Gang Cheese Press. This is one of the implements for which we predict very general use where it is made known. It is a matter of regret that all manufacturers of Dairy Implements do not take these occasions to show their wares to those who are directly interested in them.

SHORTHORN.

SUNDAY CHEESE MAKING AT FACTORIES.

A NEEDED REFORMATION.

WE have been urged repeatedly of late to bring the matter of Sunday cheese-making to the attention of dairymen with a view that the practice may be abandoned. Perhaps no better time than now could be chosen for a dispassionate discussion of the subject, since the cheese-making season is about closed and dairymen have now more leisure than in summer to consider all the advantages and disadvantages of the practice and make up their minds in relation to the course they will adopt in the future.

Again a large number of Dairy Conventions will be held during the winter in various parts of the country, and it would seem eminently proper that the question be freely discussed before these bodies and some action taken in regard to it. Sunday cheese-making appears to be more generally practiced in New York than in any other section, and it is strenuously advocated by the patrons of a large number of factories. The practice has never been in favor in Canada, most of the early factories objecting to it on the ground of its being a desecration of the Sabbath, and a breach of public morals. In some of the States it is less practiced now than formerly, or is slowly dying out, thus showing that outside of New York there is a growing sentiment among dairymen against it.

It is to be regretted that in the inauguration of the cheese factory system Sunday cheese-making was introduced. Had it been excluded from the original factories we are convinced we should not now have to contend against an evil which compels five thousand persons, engaged in the factories of New York, to labor every day in the week during a large share of the season with no chance for rest or church privileges. It is in behalf of these operatives that we now write, and we shall attempt to show, that the practice of Sunday cheese-making may be abandoned not only without serious loss to dairymen but on the other hand with the result of a pecuniary gain.

The first argument employed by dairymen, in support of the practice, is that milk worked into cheese at a factory on Sunday, will produce more money than by any other use to which it can be put by the farmer. Any one familiar with the dairy statistics of the country, for a number of years past, must have observed that the profits from butter-making are quite as large, and generally larger than from cheese dairying. Many cheese dairymen are sorely discommoded in summer on account of the difficulty in procuring good butter. Not being allowed to skim any milk that goes to the factory, they depend on purchasing butter made at farm dairies or from the creameries, and often pay from one to two cents per pound above market prices, besides the trouble of going after the butter.

We know some farm dairy butter makers who have been crowded to supply cheese dairymen with butter during the past season. Their regular customers were engaged in the spring, and no others could be supplied. These customers sent their crocks to be filled from time to time during summer, and often they could not be filled to meet the wants of all. In some neighborhoods cheese dairymen have been unable to get good butter for weeks, and they have therefore lived in discomfort on account of the scarcity, and difficulty of procuring the needed supply during hot weather, and they have been obliged to pay a good round price for what butter was used and much more than the cost would have been if butter had been made on the farm.

Now, all this could have been avoided if the Sunday's milk had been retained at the farm and set for butter making. Most families will consume as much butter as this milk will yield, but if there is more it will meet with a ready sale in market. We think that where the saving of such milk for butter has been tried, the facts will show that more money is saved to the dairyman than when his milk all goes to the factory. The skimmed milk can be utilized in various

ways, in cooking, in skimmed cheese, in making cottage, or sour-milk cheese, which by many is esteemed a great luxury in hot weather, besides being a healthful and nutritious article of food.

Another argument used is that cheese dairymen have no conveniences for the care of milk and no utensils in which to set it for butter making. We do not think this objection of much force, because at very little trouble and expense some place on the premises could be fitted up for the keep of one day's milk once a week. Those who have good cellars under the farm dwelling could very easily arrange a portion for this purpose, while the utensils used for setting the milk in spring and fall, when butter-making is in general practice among cheese dairymen, will be sufficient, we should say, for holding one day's milk once a week. But the plan may be modified so as to keep back on the farm but one milking, and this has been put into successful operation at some factories, thus instead of making two deliveries of milk on Sunday the Saturday afternoon's milking is carried early enough to be made into cheese the same night. The Sunday morning's milk is kept at home. The Sunday evening's milk is taken to the factory and there poured into vats and kept until Monday morning.

It is frequently stated that if cheese factories are worked on Sunday only a few laborers are occupied, while the rest of the dairy community are relieved. Four or five in a neighborhood do the nursery work and all others are at rest. The thought is plausible, and when first suggested will generally secure approbation. But is it right to concentrate the work of a community on a class, and to exclude a class wholly from rest and religious ordinances? If the principle is legitimate in its application to the disposal of milk, why may it not extend to all farm and family services? Why not leave the care of stock, and chamber and dining-room, and kitchen work to a select few and permit whole families to rest without lifting a finger on the Sabbath? Is it not better to distribute Sunday's labor so that there shall be no onerous burthen imposed on any, or at least that a part of the day may be set apart to every class without work?

By holding the Sunday's milk at the farm the labor of delivery is saved, and this is an item of some account since this labor must be performed by the farmer himself, or by some one in his employ. Comparing this labor with the care of the milk on the farm for the day, we shall find that the former is more objectionable than the latter, for when milk is delivered, the milk cans are to be cleansed in addition to the time and labor employed in carting. Again public considerations and regard to the general sanctity of the day are opposed to this practice, for the rattling of milk carts on the highway, particularly in the morning, is a serious disturbance of the quiet Sabbath, while the spectacle of business openly and noisily carried on during holy time shocks religious sensibilities.

But without discussing the religious points of the question we find the practice injurious to the community, offensive to sensitive consciences, destructive of the Sabbath, and an infraction of civil law, but more than all these Sunday work in cheese factories is cruelty to the operatives there. Their physical, intellectual, moral and spiritual interests suffer sorely. Their bodily vigor is reduced and ultimately exhausted, for they are subject to the law which binds the race, and that makes one day's rest in seven indispensable to the maintenance of health and strength. Their minds are enfeebled and impoverished for they are excluded from reading, from church and other privileges for which the day is usually set apart.

It has been truly remarked that the practice greatly impairs the sacredness of the Sabbath in the public mind. At first revulsion is produced and surprise created, but gradually these subside. The community becomes hardened to a secularization of the day and the worldliness of the rest of the week is poured through it. A peoples view of the Sabbath cannot fail to be debauched by the sight of its open desecration and their observance of it must be relaxed. The Sunday work at a cheese factory, and the running of its wagons, are a death-blow to the Sabbath in its neighborhood. No observer but has noted the fact. It is altogether a different day from what it was formerly in the general estimate. The practice there is an offense to public morals since restraints from vice and incitements to virtue are at least weakened if not denied.

We have enumerated some of the considerations which influence us in opposition to Sunday cheese-making. We look upon it as entirely wrong, and hope to see the practice speedily abandoned. And we suggest that the subject be earnestly discussed at the coming Dairy Conventions of the country. We know that the cheese operatives of the country are universally opposed to the practice, and would gladly seek relief if the dairymen would allow. The matter rests wholly with the latter, and not unfrequently the opinions and action of two or three persons in a neighborhood control the whole number of patrons of a factory.

In conclusion it may be well to add the following testimony which we doubt not will be endorsed by hundreds of cheese makers: The late Gen. John J. Knox of Knoxboro said, as early as 1865, in relation to doing away with Sunday cheese-making:—"I have had experience in the making of cheese at factories for the past three years. The cost of pans is sometimes raised as an objection, but I have found that the number necessary for spring and fall, is sufficient for Sunday use. If want of room for setting milk is alleged, yet only the same room is necessary for the milk of Sunday that is needed for every day, when the factory is closed. The difficulty of making good butter in warm weather we have obviated by using ice, an article which every farmer can obtain by a little expense and forethought.

The luxury of good fresh butter of the housekeeper's own manufacture is of prime account. Why should farmers be content with an inferior article from hay-fed cows, when their tables may be graced with yellow, tempting rolls obtained from cows fresh from the pastures? Many families also find "Dutch Cheese" no trifling luxury during the warm season. At a time also when the price of pork has risen so high, the milk of one day in the week is an important item to those who prefer to keep their own pigs for fattening." "And we ought to take no narrow view of the subject. Whatever relaxes the sanctity of the Sabbath, is sure to lower the standard of public morals and to depreciate every material interest. *The value of real estate in a community is affected by the fact whether or not that community is a Sabbath-keeping and church-going community;* and cheese factories in operation, set the example of a conspicuous violation of the Fourth commandment and encourage and embolden the public to practice it."

Mr. John Newkth of Litchfield, N. Y., says: "I have kept a cheese dairy for sixteen years, and live within two miles of three factories and am the salesman for one of them, and have the opportunity for freely visiting them all. I have never seen the time when I believed Sunday cheese-making to be a work of necessity, and I think all our factories would make nearly as much cheese from six day's labor as they now do from seven. I presume that a large majority of those running factories are not only willing but desirous to rest on the Sabbath, as but few can endure their incessant labor." The subject is one of great interest and importance, and we hope to see it agitated among dairymen during the winter, and that the cheese factories of the State may begin the next year's operations by dropping Sunday work.

HOW GOOD COWS ARE PRODUCED.

The remark has often been made by dairymen that village cows, or cows bought from persons who keep but one or two animals at a time, fail to yield so much milk when placed in the herd on the farm as when in the hands of the villager, or owner of one or two animals. We have known dairymen to purchase the single cow from the villager, because of her notoriety as a deep milker and at a very large price, but in almost every case the animal, when placed upon the farm with the other cows, turned out to be no more than an ordinary milker, though well known to have been superior in this respect when kept as a single cow. Again, on the other hand culled animals from a large herd when sold to persons keeping one cow, have turned out to be remarkably good milkers. Instances of this kind have come under our notice many times, and during the past summer a notable example was shown us where two cows had been sold by a dairyman owning a large herd on account of their small yield of milk. Yet when placed away from the herd and pastured by themselves, apart from other cows, they rose to first-class milkers equaling in their yield the best cows in the herd of their former owner.

Those who have watched the record of remarkable cows, noticed in agricultural and other journals, will perhaps have observed that these extra large yields have been made almost invariably by the one or two cow dairy. Now the explanation of this fact is, that when the cows are kept singly or in small numbers, they generally receive more care and attention, are petted more, while they get better and greater variety of feed, all of which tend to a larger secretion of milk. We do not mean to imply that there are no extraordinary good milkers in large herds, because this would not be true, but what we are to learn from the facts named is, that kind treatment and care with attention to study the wants and disposition of milch stock will make a vast difference in the yield of milk.

As an additional verification of what we have said, we find in a late number of the Country Gentleman, a communication from Philip Snyder of Vineland, N. J. In 1875 he bought a common cow which had been picked up in Philadelphia by one of the butchers of Vineland, and after she had changed hands several times, Mr. Snyder purchased her for $56. He describes her her as large, handsome in shape, docile and young—about six years old—and at the time she come into his hands was giving about 8 quarts of milk per day. Mr. Snyder has been careful to keep an exact record of the milk of this cow during the past year, and we find that she gave from the 15th of January to Oct. 30th a total of 9,084 pounds of milk. The amount of butter made from her milk during the same time was 320 pounds, which, adding the amount which could have been made from 568 pounds of milk sold and the total yield of butter during the 290 days, is 341 pounds 7 ounces or 18 83-100 ounces per day. Now as this cow was yielding in November up to the 16th, at the rate of 16 pounds 15½ ounces of milk per day, Mr. Snyder concludes that it is not extravagant to suppose that in the 59 days yet wanting to complete her full year, she would give enough more to make her total annual butter capacity amount to 400 pounds. This certainly may be considered a remarkable yield from a cow of "no particular breed."

Now as to her treatment; Mr. Snyder says his farm being a fruit farm the cow had no pasture whatever, and very little green fodder. Her diet and manner of keep are detailed as follows: "Her regular diet has been dry, mixed hay, averaging 18 to 20 pounds per day, with 4 quarts of mill feed, ⅓ meal, 2-3 bran, each morning, noon and evening, also about one pint of oil meal per day. This and the mill feed is given in a pail of warm water. Whenever we can get a bite of grass for her she gets it, but she has not had 200 pounds of it in the two summers I have owned her. That enterprising weed, purslane, is furnished in its season as often as we can find time to pull it up, and sometimes green fodder corn, but the latter does not seem to increase the flow of milk. She is stabled winter and summer; in cool weather on the barn floor, tied in a stall about 5 feet wide; in mid-summer in the barn cellar, in a sort of box stall, about 10 feet square, where she can fight flies at her leisure. At present prices of hay and mill feed her cost of keep is about 30 cents per day."

Mr. Snyder says that this cow has never given any extraordinary masses her best being 40 pounds 12 ounces on April 23d, and in conclusion he remarks that "it may be set down as a fact that judicious care and feeding will always pay and *vice versa*." To this we heartily subscribe and our experience teaches us that there would be many more good cows in the country if this principle were better understood and appreciated.

In the production of good cows we do not under-estimate blood and good breeding, but what we wish to impress upon dairymen is that there must be something more than this, and that is that kind care and judicious treatment are often capable of making a superior milker from an animal with no "royal blood in her veins" while the reverse makes a poor milker out of the best bred cow in the land.

Farm Economy.

PREVIOUS TEACHINGS.

Beware of the teachings of our ancestors and of every kind till there is positive proof of their truth, for the most startling exposures of the follies implicitly believed as being sound sense, are every year coming to light.

When I was a boy bleeding was so general that it was done periodically with man and beast, every barber was as well prepared to take blood as to cut the hair, and healthy men would be bled every spring and autumn, and every blacksmith would bleed and give a ball of physic whenever a horse seemed a "little out of sorts." Doctors who used to follow the fat hounds always had lancets in their pockets, and farmers generally carried fleams so that if a sportsman had a severe fall from his horse blood would be let with the lancet, or if a horse was injured by accident or over-ridden the fleam was used to take blood from him. Now, in less than half a century or not more, any one would be judged insane to do it.

It is not very much longer since mankind believed in witches, wizards and witchcraft, generally, also in the appearance of ghosts, and in fairies as well as in the visits of the old fellow from below in all manner of shapes and forms. The moon too had influence on the blood, on wounds, on meat and every kind of pickle or preserve, and likewise the brain of every excitable being was said to be affected much more strongly at certain stages, and the term lunatic came from this teaching. However, there are at large a most extraordinary number of moon-struck people in the agricultural districts at the present day, who charge all manner of misfortunes to the poor innocent moon. It is wonderful what effect previous teachings have, for the minds of the young are so impressible that they readily believe what is told them by their parents and associates, but it is deplorable that there should be so many foolish errors and stupid falsehoods believed, making those who credit such absurd stories, appear so very ridiculous.

Setting milk in deep or shallow vessels was said to make a great difference in favor of the latter and a warm dairy was necessary in winter; now recent experiments prove these teachings erroneous, for so that there is no actual frost the cream will rise as well as if 20 or 30 degrees warmer, then when I was in England the farmers' wives always held the opinion if butter was churned very quickly there was not so much of it, now the churns that will turn cream into butter and buttermilk soonest are prized as the best. It is difficult to imagine what most outrageously extraordinary folly men might be brought to believe if the previous teachings began with the education and were continued unrefuted.

Working Farmer.

DESTROYING RATS AND MICE.

There is many a farmer's barn at this season which might be appropriately termed a huge "ratary," from the number of these destructive little animals which infest it. The amount of grain destroyed by a few dozen rats would keep a hog or cow through winter, and it is a pity to let such vermin consume food which is so much needed by more useful animals, when, by a little care and attention it might be saved. The destructiveness of rats and mice however does not stop with the grain they consume, but they gnaw holes through bins, barrels and other vessels, frequently letting their contents run to waste, besides, harness, carriage robes, blankets, grain bags and various other articles are in constant danger of being destroyed by the pests.

But, say some of our correspondents "we have tried almost every thing, to rid our premises of this pest, all to no purpose, and here they are this winter as abundant as ever." The dog, cat, and trap have all made war upon the rats without an *apparent* diminution of their numbers, all of which may be true, but it is a question if the few destroyed by these means have not been a benefit. Rats are migratory in their habits, and they very soon discover where the best food can be obtained at the least risk of their lives, hence they will go from one barn to another, or even travel miles in a night to find a peaceful, quiet place where at the same time food is abundant.

We have known them to vacate a farm barn in a night, in consequence of one of their number being severely wounded with shot. Then, again no amount of shooting, harrassing with dogs, and traps, would make them leave, still there is a way in which one's premises, especially farm-buildings can be freed from this vermin, and that is by poisoning. But before a man attempts to make a raid on rats and mice with such weapons, he should prepare a private appartment for their especial reception where larger animals cannot intrude. A room in the cellar or attic may be set apart for this purpose, or even a large box will answer, the entrance to it being just large enough to admit the victims. Then a royal feast may be prepared for them of dainty bits of cheese, bread and oatmeal cake, but not at first poisoned, for when there is plenty of grain about, rats are not readily enticed into new quarters in search of better food. But after baiting them for a few days the work of destruction may be begun. Of course, there are a variety of poisons which can be used, but some of them are quite too dangerous to have about where there are dogs, cats and other larger animals who may pick and eat a poisoned rat or mouse, consequently we recommend some kind not quite as dangerous as phosphorous paste and strychnine, although these can under many circumstances be used with safety. But whatever poison is employed, water should always be placed conveniently at hand, and inside of the room or box where the poisoned food is set, in order that the rats may quench their thirst and die on the spot.

As rats are very intelligent and capable of warning their fellows of danger, it is frequently necessary to change the location of both traps and poisons if these animals are very abundant about one's premises.

Poison No. 1.—A pint of plaster Paris thoroughly mixed with a quart of oatmeal will prove fatal to either rats or mice.

Poison No. 2.—Carbonate of Barytes two pounds, common lard, one pound, mixed together and left where the rats can find it. It is tasteless, odorless, and impalpable, but produces extreme thirst, causing death immediately after drinking.

The frozen earth covered with early, compact snow bespeaks good crops next year.

Field Crops.

TOBACCO CULTURE IN PENNSYLVANIA.

JOHN A. WITMER in writing to the American Journal of Pharmacy about tobacco culture gives some hints which may be of service to our readers, as it will soon be time to commence making preparations for sowing seed, if strong and vigorous plants are to be obtained for early spring planting in the Middle and Southern States.

The seeds which have been collected the previous autumn are sown in early spring in cold frames. These frames consist of large oblong boxes, without bottoms, two or two and a half feet deep by three feet wide, and covered with glass. They are prepared in autumn by being filled with rich earth and fertilizers. In selecting a site for these frames, a sheltered spot having a southern exposure is preferred. They are additionally protected from the weather by being covered with straw, &c. Persons making "plant raising" a specialty sow as early as the 15th of February. After sowing, the frames are covered with glass alone during the day, and sheltered at night. The earth being kept moist, the seeds soon sprout, and the little plants appear. Additional care must now be taken to admit the sun during the day and to protect them from the frosts at night. Persons not desirous of having plants early or for sale, do not take the precautions above enumerated, nor do they sow as early. A warm, sunny spot, having a rich soil, or one enriched by fertilizers, is sufficient for their purposes.

When quite young, the plants are frequently infested by the "plant louse," an insect belonging to the genus *aphis*.

When the plants have attained the hight of several inches they are transplanted to the fields. This is rarely done before the 15th of May to the 1st of June. The fields are ploughed the previous autumn, as by so doing it is thought that some of the insect enemies are destroyed. In the spring the soil is loosened and then ploughed in such a manner as to form ridges one-half to a foot high, at a distance of two to three feet. A wet day is chosen, as the plants require much moisture to continue their growth without interruption; for at best a large percentage die, owing to want of sufficient care in planting or the ravages of the "cutworm" (different species of the genera *Agrotis, Gortyna,* &c.), which is the principal enemy at this period of their growth. They are concealed in the earth during the day, and go on their errands of destruction at night, cutting off the plant while it is young and succulent. The only means of preventing the ravages of this enemy is to seek for him in his hiding-place, and when found kill him. These belong to the order *Lepidoptera*, or scale winged insects.

After the plants have been thoroughly rooted one of the principal objects is to keep down the weeds, which grow luxuriantly in the rich soil. This is accomplished by hoe harrowing, and the hand hoe until the plant grows too large to admit the passage of a horse and harrow without injury to the leaves, after which the plant is strong enough to suppress the weeds, when it grows very rapidly, soon attains the hight of three or four feet, and puts forth the flowering head. This is broken off when leaves are the object of the cultivator, but when seeds are desired the inflorescense is left to develop. Cultivators differ as to the proper time to "top" or break off the flower head. Some prefer to top when the stem has six or eight leaves, while others think ten not too many. After being topped axillary branches are put forth, which are popularly known as "suckers." These are broken off as soon and as often as they appear. The whole plant is now covered by a viscid resinous substance, commonly called "gum," which renders it very unpleasant to handle.

After this time, tobacco's greatest enemy makes its appearance, namely, the "tobacco worm" (*Sphinx Carolina*, Linn.) This, the larva of the grey American hawk-moth, is a green worm, sometimes as large as a man's finger. Allied to this is the *Sphinx quinquemaculata* of Stevens, the larva of which sometimes infests tobacco, but more frequently the tomato and potato. These moths hide themselves and sleep during the day, and at night they go forth to deposit their eggs in patches on the leaves. During the early hours of summer evenings they may be seen hovering over the flowers of the "Jamestown weed" (*Datura Stramonium*), from which they extract the exuding juice. By the introduction of some virulent poison into these flowers numbers of them might be destroyed. These also belong to the order *Lepidoptera*. The larvæ are very destructive to the leaves, and I have known instances in which one worm has eaten an entire plant in a single night. They are watched very closely, picked off by hand, and destroyed.

Of late years, a very destructive enemy, in different species of *Arma* (*Arma modesta, Macula*, &c.), has been noticed. These belong to the order *Hemiptera*, or half-winged insects, and deposit their eggs in patches of thirty to fifty. When the young are hatched, they puncture the leaves, and suck the juice of the plant. When a leaf has been punctured by these insects, it rapidly withers, and presents the appearance of having been scalded. As yet no practical method has been adopted for the destruction of this enemy.

Scientific and Useful.

PATENT FENCES.

THERE are probably very few of our readers residing on a farm who have not had a visit from the dealers in "Patent fences," and to this class the following, from the National Live Stock Journal, will doubtless be interesting, and perhaps instructive:

The large and annually increasing cost of enclosures will account for the readiness with which farmers are imposed upon by every new invention that is inaugurated under the plea of economy. Most of the recent inventions are for working up the old rails in our worm fences into panels, and fastening these together and so bracing that they will stand in a straight line without sinking posts into the ground. By some of these methods fences are constructed which appear quite substantial and firm when first put up, but in a short time some of the nails or wires used in attaching the braces begin to give way and the fence which promised to be substantial and permanent, is found to be of but very temporary utility. The fact is, that no contrivance has ever been invented, or ever can be invented that will dispense with the necessity of anchoring the fence to the ground; and all the new inventions of cross-pieces on the surface with braces attached, while they are about as expensive as a good board or post-and-rail fence, are found to last but a very short time. Farmers may therefore make up their minds that the old method of hedges, with board-and-rail fences, are better; and, in the long run, are cheaper, than any of the new inventions.

Where there is plenty of timber, the old-fashioned Virginia worm fence, though a little unsightly, is as good and as cheap as any. Next to this in economy and durability is the board or the post-and-rail fence. These fences need not, where stock is properly managed, be more than three feet and a half to four feet high, and usually four rails or boards to a panel will be sufficient; and three will answer to turn any kind of well-behaved stock except swine. The less lumber we have in the fence, the better it will stand.

In making these fences, the great and important consideration is, to cut the timber at the proper season—say August or September, or in mid-winter; and it is believed that if the posts are seasoned when put in the ground, it will add one-half to their durability.

These fences, with posts of moderate size, set 18 to 20 inches in the ground, with three to four boards or rails in the panel, may be found in the neighborhoods of all our large cities, and in the most highly cultivated agricultural districts, proving conclusively that experience has demonstrated that no better or cheaper methods have been discovered.

Besides these considerations, we have added the very important one of appearance, which, in all our improvements upon the country homestead, should always be attended to. A neat, light, post-and-rail or board fence—the boards should not be more than five inches wide—always looks well, and is, we think, except for outside fences, to be preferred to hedges.

Fig. 3.—VIEW IN RURAL GROUNDS.—See page 422.

THE CONCUSSION THEORY AGAIN.

SINCE writing editorial note in RURAL of 16th inst., on Col. HARDEE'S concussion theory, we notice that our veteran "Concussionist" himself comes forward to claim what we awarded him without a doubt as to his title as discoverer. Of course we stand by the Colonel in his fight for the glory of being the discoverer of this method of destroying insect life, for our motto is let them laugh who win. The following characteristic note to the Florida Agriculturist tells the whole story:

Some years ago I accidentally discovered that concussion of the atmosphere, brought about by the combustion of gun-powder, would destroy scale-insect and all parasitic life, and gave my theory to the public. It was then discussed by all the agricultural journals of the country, and the National Pomological Society, at Richmond, Va.; Marshal Pickney Wilder, then its President, November 23d, 1868, acted in the premises. A committee investigated the theory, and it was received as Hardee's theory of concussion. The theory was widely discussed in this country and Europe, and several parties have claimed since then that it was their theory, and now there is "another Richmond in the field." A Mr. S. F. Gard, of Louisiana, calls it his theory, and says it was accidentally discovered in shooting at night at a hornet's nest, a few months ago. I could throw over Mr. Gard's statement a veil of charity, but he copies my exact language, when he says "the concussion must be at night, when the dew is on the orange trees, to make it effectual," &c., &c. Since my first discovery, eight years ago, the scale insect has been successfully managed at Honeymoon with this remedy, and I bid them defiance. But, to return to Mr. S. F. Gard, after he claimed it as his theory, he says it was used in Louisiana fifty years ago.

Now, Mr. Editor, there was no scale insect in the United States fifty years ago, they having made their first appearance in the United States at Fort George Island, at the mouth of the St. Johns River, imported on some foreign orange trees, brought over by Mr. Kinsley Gibbs, I think, in the winter of 1848. Some twenty-three years ago, at my orange farm, then known as "Rural Home," I tried everything I could think or hear of against the scale insect, but failed, and when I discovered this new theory I was in such ecstacies that the Hon. James M. Baker, to whom I first told it, thought I was crazy.

The theory is a correct one, and I have lately purchased a twenty-pound cannon for the purpose, and if I could be permitted to fire it over the head of this S. F. Gard of Louisiana, I think I could destroy some other insect, that is worrying him more than the ambition to be the author of the concussion theory, and I now throw down the gauntlet to Mr. Gard, and, to more effectually rouse his energies to come forward with the proof, I simply say to him, he cannot steal the honor of being the author of the concussion theory, and the said honor is claimed by Yours respectfully,

L. A. HARDEE.

Insurance Department.

AN OUNCE OF PREVENTION.

FOR obvious reasons more farm property is destroyed by fire in winter than during any other season, and since the appliances for controlling fires after they break out are few and nearly always inadequate, extreme and constant vigilance should be exercised. The most frequent causes are defective flues, especially where the stove pipes are inserted, or where ceilings are pierced for pipes; and carelessness in the use of matches and kerosene. Where pipes enter brickwork a large sheet of tin or iron closely fitting the pipe should be nailed firmly to the brickwork and the lower part turned up to form a gutter in which casual sparks may fall. Kerosene is always a treacherous article, nearly as dangerous and destructive as gunpowder, and should be used only in stationary lamps set into brackets. Its use in portable lamps of the usual pattern is a perpetual menace to life and property. This is especially true of the ordinary lantern with thin glass sides and chimneys used in barns and stables. The old-fashioned tin cylinder pierced with small holes and lit with a bit of tallow candle does not give as much light, but has the merit of perfect safety. Mrs. O'LEARY'S famous cow might have kicked one of them to atoms without endangering the city of Chicago. The common match is only less dangerous. They should be kept in tin boxes, nailed to the wall so high that neither children nor mice can obtain access to them. The former like them just a trifle more than any other dangerous and forbidden article, while the latter have a strange avidity for the phosphorus with which they are usually tipped.

Arboricultural.

A NEW EVERGREEN.

Sequoia gigantea is the proper name of the "Mammoth Tree" of California—a fact which our English cousins recognize, while they still persist in calling it *Wellingtonia gigantea*, for the reason that this name, having been "adopted in garden literature, had much better be allowed to stand, as its alteration would cause great inconvenience and much confusion in practical botany."

Wellingtonia is a smoother name than *Sequoia* and honors a noble English name. *Sequoia* commemorates nothing, unless it be a Cherokee Brave, *See-qua-yah*, who, as Mr. HOOPES remarks, spent his life in endeavoring to enlighten his race by inventing an original alphabet and by the introduction of mechanical contrivances and useful implements for their benefit.

Washingtonia gigantea, a name given by KELLOGG, is as smooth and pretty as *Wellingtonia*, and, were the tree entitled to it by priority, we should much prefer it to either of the others or to any of its dozen synonyms. But it is not. ENDLICHER established the name of *Sequoia*. This is American and the tree is American, and, whether it mixes up English garden literature or not, we hope that, outside of England, it will never be generally known by any other name.

We need not refer to the world-renowned size to which this tree attains in California. Our object in referring to it at all is to introduce to our readers one of its children—a degenerate child that, inheriting but little of the grandeur of its stately parent, is introduced to the world as *Wellingtonia gigantea pendula nova*, represented in the accompanying sketch. *Nova*, we presume, will be left off, as there is no *old* weeping *Sequoia*.

The original plant was raised from seed six years ago at Carlisle, Eng., by LITTLE & BALLANTYNE, nurserymen of that place, and it will be for sale not until next autumn.

There is also a variegated *Sequoia*, but the variegation, of a straw color, is spasmodic, and, though advertised by many nurserymen, it does not "command," so far as we can learn, "a place in every collection of any pretension."

GOLDEN VARIEGATED DECIDUOUS TREES.

ON first looking about, preparatory to commencing his work, the painter naturally examines closely the pigments with which it is to be wrought, and judges are wont to say now-a-days that marked loss in enduring qualities may be detected in the fading, adulterated tints of many modern pictures. In like manner, the designer of artificial landscapes, amateur or professional, needs to study well the nature of his material, for the simple reason that living plants exceed dead mineral paints in delicacy and complexity. He must secure health, hardiness, and the native symmetry that comes by intelligent pruning. He must know habits and capacities, that he may be able to arrange for future effects on maturity, and accomplish certain more immediate results. But, above all, he must have variety and abundance of color to give the indefinable finish of contrast, shading, and harmony, that is essential to the perfection of a noble picture.

To assist in accomplishing this in a greater or less degree, we propose to remark on a few of the most prominent and effective varieties with curious-colored leaves, commencing with those of a distinctly golden type. In general terms, we may say, by the way, that all forms of variegated shrubs and trees should be brought forward, conspicuously, near walks, and individual plants of each group disposed on the principle of large to the rear and small to the front. The composition of colors will, of course, be controlled by personal taste. It may be well to notice, also, that all variegated trees tend to dwarfer forms than those of the parent species.

The Golden Alder (*Alnus glutinosa aurea*) is a striking tree of pure gold color and much beauty.

The Golden Ash, as represented by two very similar varieties, *Fraxinus Americana aucubæfolia* and *punctata*, spotted more or less with gold, is hardy, distinct, and enduring, resembling, as usual, the parent in general form.

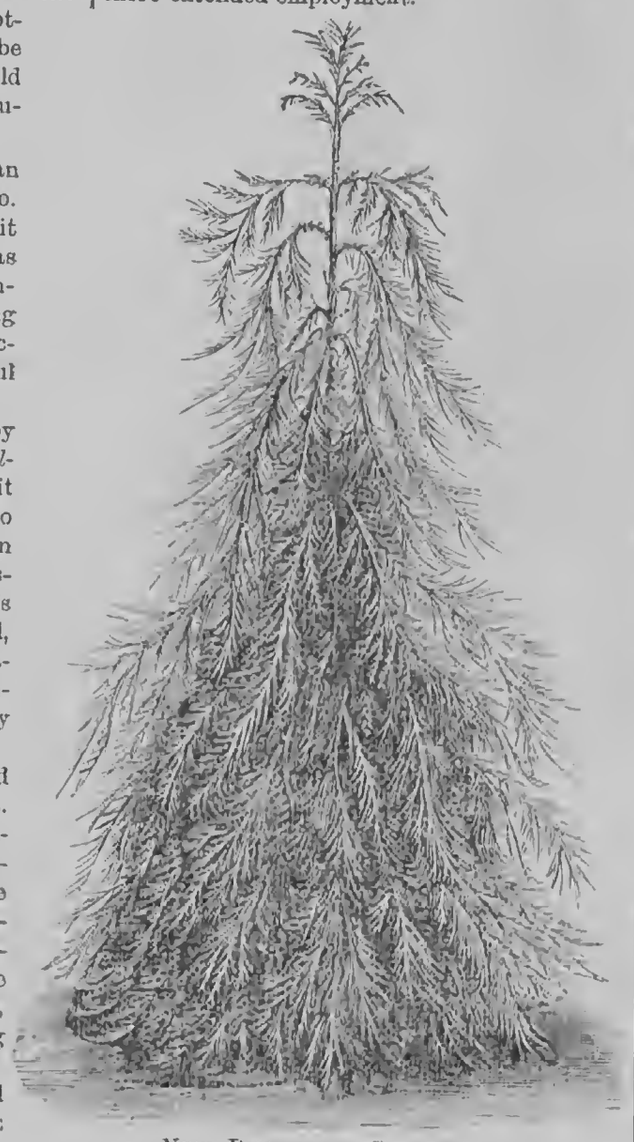
The Golden Catalpa (*Catalpa syringifolia aurea*) is broadly blotched with gold, and has the large, massive character of leaf and round, spreading head of the parent.

Roessell's Golden Elm (*Ulmus campestris aurea*) is a dwarf form of the English Elm, with leaves richly suffused with gold. It is an enduring variety and a decided acquisition.

The Golden Hornbeam (*Carpinus Betulus aurea*) is distinctly marked with yellow over half the surface of the leaves, and has the parent's sturdy habit and persistent retention of foliage in autumn.

The Golden Horsechestnut (*Æsculus rubicunda aurea*) has curious leaves, marginated with gold in wavy masses, and is a remarkable and valuable form, of much larger habit than the last.

The Golden Magnolia (*Magnolia acuminata aurea*) is finely marked and well deserving of more extended employment.



NEW PENDULOUS SEQUOIA.

The Golden Japanese Maple (*Acer Japonicum aureum*) has probably the most exquisite coloring of all golden-leaved trees. Its type is dwarf and allied only to Japanese forms, but the round, scalloped leaf is shaded and tinted with soft gold on convex surfaces in a manner most marvelous. The variety is very rare and difficult to propagate, although, in common with all Japanese Maples, well suited to American summers and winters.

The Golden Sycamore Maple (*Acer pseudoplatanus aureum*) has a decided golden color tinging its broad leaf, but, more than most others of the class, it loses this valued tint as the season advances.

The Concordia Oak (*Quercus pedunculata concordia*) has, and deserves, the very highest rank for purely golden leaves and sturdy, enduring habit. Its size at maturity about equals that of the ordinary Oak.

Another variety of Golden Oak (*Quercus pedunculata aurea viridis*) is still rarer and, if possible, more beautiful than the last, with a more refined type of beauty. It is broadly blotched, or maculated, with yellow.

The Golden Plane Tree (*Platanus occidentalis aurea*) has all the virtues and defects of the parent, and is finely tinged with yellow.

The Golden Tulip (*Liriodendron tulipifera aurea*) is as noble an acquisition as the parent would be considered if recently introduced. The leaves are very broadly marginated with permanent gold.

All, or most all, of these golden-leaved trees are, and must long remain, somewhat expensive, partly from rarity, and partly from the necessity of grafting to retain their colors in perfection. Seedlings prove so variable, in their tendency to revert back to the original green type, that little worth should be attached to them, and layers, with their ill-formed system of roots, afford so crude a method of propagation, that we can but take the apparently more expensive grafted plant.

To prevent disappointment, it should be remembered that all colored leaves fade somewhat under the severe test of summer; but, although the golden varieties named differ much in this respect, the general character is that of great constancy under trial. SAMUEL PARSONS.

LARCH BLIGHT.—The blight which attacks the larch in Europe is said to be caused by a small insect known to entomologists as *Coccus laricio*. It is said to increase with wonderful rapidity in warm weather, and in a similar manner as the common Aphis or Green fly—females only appearing in spring, and this sex is reproduced for thirty or forty generations without the appearance of any males. The Blight, as it is called, attacks only sickly trees, or those growing on poor ground, where they are quite feeble.

The Vineyard.

ABOUT SOME GRAPE VINES AND GRAPES.

EVERYBODY else has had his say on this subject and why should not I have mine? I have cultivated, on a small scale, twelve of the common varieties for several years. I have a few others, once fruited, and some twenty others not yet in bearing. I shall not attempt to criticise the tastes or fancies of others in varieties. I have never been remarkably successful, and am aware that there is a great difference in localities in their adaptation to this fruit. I am inclined to think, however, that climate, either local or general, has much more to do in the matter of success with this fruit than soil. By local climate, I mean that which is affected by the immediate surroundings, such as aspect, altitude and deep water. Even in the most favorable localities our most popular varieties require for their fullest development of sugar a longer or warmer summer than we usually have north of 41° of latitude.

The time of ripening then is one of the most important matters to be taken into account in the selection of varieties for any locality in the Northern States; and my reading and observation warrant me in saying that our most experienced growers are now selecting both for the table and the wine press, those varieties that they can safely calculate on ripening, rather than those of acknowledged superior flavor.

On the subject of winter protection, I would say: that the most critical times are the first fall frosts and the sudden freezing in spring after a few days of spring weather; and it is always a measure of safety to lay the vines on the ground, after the fall pruning, and to lay blocks or poles on them to keep the upper branches below the snow line, and a few brushes, a little straw or some such refuse (I use the asparagus tops), laid over or even under them, are more of a protection than most would believe without trial. Should the snow go off early, extra protection can then be added. In keeping qualities, there is a very great difference in kinds as well as in the methods adopted by different persons to keep them. As to myself, after trying several plans and losing many grapes, I have adopted the following:

I make frames about 14 inches by 4 feet, of slats of half the width of a lath, placed half an inch apart for drying fruit generally. For grapes, I raise these an inch or two from the floor, select open bunches and spread them on the frames, which, to save room, can be laid in tiers by strips between them. On these I have now Delawares, Clintons, Ionas, Dianas and Salems. Of these the three first have the raisin form of shriveled skins, but have still some liquid juice. The Salem being a larger grape (though on small clusters), is not so much shriveled. The Delawares are good, but not much improved by the process; the Clintons are very much improved in flavor, and persons who "never could like Clintons," like these. The Ionas are splendid, everybody likes them, and the skins are tender and edible, like the imported raisins. The Dianas are good inside; but the skins would make good leather aprons, and that is about all there is of them. The Salem I have saved for the first time, and can only say that I think that in time it will make, in texture, flavor and sugar, a most perfect raisin. The keeping qualities of the Concord I have never tried. I have no faith in it for keeping. When in its greatest perfection I like to eat it, but that condition remains but a very short time. Very few are marketed, except when unripe or overripe; but still, for market, I think there is more money in it now than in any other. My preference is for the Clinton for my own use. Taking all things together and subtracting its bad from its good qualities, it leaves for me a better balance than any other I have tried. For market it is worthless, unless kept till fresh grapes grow. I could write a eulogy on its merits for home use. The idea of keeping grapes fresh and plump I consider more a matter of fancy than utility. In drying, nothing evaporates but water, and it is a question with me whether the amount of sugar is not increased and the acid diminished by the process. At any rate, I never tasted grapes so much to my liking as those now before me.

S. B. PECK.

CLOSE-PRUNING VINES.

WE have in our grounds a Clinton Grape-vine sixteen years old, with a stem about four feet high. For the last twelve years it has been "Buck"-pruned—that is, all the young canes are cut back to within one or two buds of their base, about a dozen in all being left on the head of the stem.

Although the Clinton is one of the most vigorous of our native varieties of the Grape, and one which many of our vineyardists claim will not withstand close pruning and produce fruit, still the vine in question has not failed once during the time named to bear a dozen or more handsome bunches, the berry ripening finely.

The past season the fruit on this vine was as good, if not really better, than ever before, and we begin to get discouraged in our attempts to kill, or even weaken, this vine by close pruning, which some persons claim will destroy any and all of our native sorts.

The Horseman.

CLIPPING HORSES.

THIS was done a great deal in England, forty years ago, and shaving, too. About forty-five years ago I was just beginning to ride after the fox-hounds. I was a farmer's son and kept a nag or two of my own, and met the Warwickshire hounds (a subscription pack), the Duke of Beauford's pack, and then Col. Berkley's (afterwards Lord Leagrave, then Earl Fitzharding). A good many horses were shaved in the latter end of September and beginning of October, carefully covered with linen under the rug for the first week after, and these would have an even, short coat of hair; but quite a number were clipped in October and November, and, when nicely done, grays looked well, but it spoiled the gloss of the black ones and changed the shade of the bays and chestnuts. However, for all quick-working horses, there was never any question about the comfort to the animal and, more especially, the relief of the groom, for, of course, if the horse had to stand anywhere on the journey, a cloth and breast cloth, also, were put on just the same as on all short-coated horses, which have their hair remaining short, from being confined in the stable early (August) and kept so as to prevent the growth of the hair.

About thirty years ago singeing became general, instead of clipping, and this was done with a kind of comb, with teeth like the currycomb, and a wick and oil running so that the flame would catch the hair as it rose from the combing. Some used spirits of wine, but mostly naptha, and this being done once a week, and commenced as soon as the hair began to grow, took off but little each time. It was very quickly done, and did not change the color, and the first sweat after took off with the grooming, the peculiar smell, etc., of burnt hair.

In England this is doubtless still done, and when a horse is had up late in the autumn, or from any other cause has a very long coat, clipping is probably still resorted to, because singeing can't be done evenly with long hair. Cart, or what are here called heavy draft horses, have nothing of this kind done to them, their hair is longer, naturally, and they are never driven so fast as to sweat much. Besides, they lie in cooler stables, and have to stand about often while cart or wagon is loaded, so that more hair is necessary to keep them warm, and farmers in England, of the first class even, never think of clothing their teams, for they all have their "nag stables" totally distinct from the "cart stables," and their saddle horses never have a collar on, and their driving nags seldom do aught on the farm, beyond, perhaps, harrowing a little in a busy seeding time.

In the Northern States of America, for a doctor, whose groom drives him in his rounds, a clipped horse is best, because he can be driven very fast, thus saving time, and the groom can carefully keep the clothes on, breast cloth and hood, too, in cold spells or a long stop, and he can stir him around also, and so in all cases similar to a doctor's work, or on regular stages, to a coach or other vehicles, the clipped horses are better for their own comfort and the groom's attendance, for they are comfortable in a few minutes after being put in the stable, whereas, with long hair, they will not dry and break out sweating again, so that a fellow may "work his heart out" and they will still look miserable.

WORKING FARMER.

HEAVES IN HORSES.

I SAW an article in the RURAL NEW-YORKER, sometime last summer, in regard to heaves in horses, which prompts me to give my experience with this disease. I came to the conclusion, many years ago, that heaves were brought on by using dusty hay and other kinds of food. Consequently, I commenced to dampen all the hay fed to my horses, and since that time, I have seen no signs of heaves among them. Before I commenced this sprinkling of the hay, I had two or three which had it, and although I do not think there is anything that will cure horses when the disease is once well seated, still, in my opinion, dampening of the hay and feed is a sure preventive.

JOHN MEHAN.

To keep horses free from "grease," or scratches, their legs and feet must be kept clean while standing in the stable and rubbed so soon as they come out of the wet and snow.

Floricultural.

MISCELLANEA.

Bee Flowers.—We are reminded by Prof. Beal's article upon plants most visited by bees, published in another column, that the *Aster Novae-Angliae* attracted more bees than any other flowers in our grounds. This Aster, under cultivation, grows to the hight of about six feet and bears thousands of flowers. From morning until night these were visited by bees in such numbers that there seemed several bees to each flower. The hum from so many busy workers and their excessive industry, as if no time was to be lost in gathering so rich a feast, so impressed the writer that, should he ever establish an apiary, this Aster would be among the first flowers cultivated for its use.

Vine Ornaments.—We heard a lady of much floral taste, and a botanist, too, remark that for vases, either in-door or out, she preferred *Lysimachia nummularia* (the Golden Moneywort) to all other trailing vines and Smilax for the ornamentation of the conservatory or sitting room.

We remember a rustic box elevated two feet above the earth upon the stump of a small tree. The vine had concealed both box and stump, flowed upon the earth, taken root and formed a carpet. Over this, and reaching midway to the ground, were *Tradescantias*, purple, variegated, green and white lined. In the center, trained to strings to a circular wire two feet above, was Smilax, which, having twined about the ring, had fallen over so as to meet and intertwine with the *Tradescantias*. Simple as are such garden ornaments, easily as they are formed, they are often more captivating than more pretentious vases that have been contrived and arranged with all possible care and no little expense.

A Vase of Pansies.—We saw last summer a low, iron vase, two feet in diameter, filled with Pansies—black Pansies, and those only. The vase had been filled with leaf-mold from the woods and thoroughly decomposed manure. It was so placed as to receive only the morning sun. The only care necessary was to prevent the earth from drying out, on the one hand, which would at once have made the flowers smaller, and on the other, not to give too much water, which, without increasing the size of the flowers, would have induced a leggy, straggling growth.

This vase was a beautiful success, and as odd as beautiful. Pansies need rich earth, shade and moisture during our scorching summers. If we cannot supply those requisites, we cannot have fine Pansies.

Roses for Damp Places.—In the grounds now devoted to the Rural New-Yorker—which, as we cannot have all our friends visit, as we would wish to do, we shall present them with several scenes from sketches made last fall, though not until after frosts—is a lake that has afforded us the opportunity of experimenting with many plants as to the degree of moisture which suits them.

A "Madam Trotter" Rose-bush was planted so that its upper roots are enveloped in perpetual moisture, while its lower ones extend beneath the water level. The first summer it grew so rapidly that we feared its wood would not ripen, and that, in consequence, it would be killed by the winter. Not so. It has since thriven as we have never known a Rose-bush to thrive before.

NOTES.

To the Editor of the Germantown Telegraph.

Another Pretty Handy Vine.—I have seen a notice in the Rural New-Yorker of the vine Variegated Ampelopsis, or *Vitis heterophylla variegata*. I did not suppose it, however, to be a new or rare production, as I have one eight or nine years old. Permit me to call the attention of your readers, who are lovers of the beautiful, to this charming hardy vine. It is woody in its nature and jointed like the grape, of which I think it must be a variety; is perfectly hardy here, having stood the severe winter three years ago, growing on the east side of the house. The leaves are deeply lobed and beautifully variegated with white and two shades of green, and often in young plants a shade of pink; is easily kept in shape as regards size or training, and would be attractive for greenhouse or conservatory, as it likes a partial shade to give it its finest markings or variegations. The fruit is about the size of currants and of various colors as they mature, being from an azure hue to a very pale blue and green. It is very nice for trimming the hair all seasons, either in blossom or fruit. The one I have is greatly admired, and I have grown it for friends by layering, from cuttings, and even from seed as well, the seedlings coming true in every case; I raised some twenty-five or thirty the past season. It is the most beautiful hardy vine I know, and is deserving of extensive culture. Mrs. Mary Olin.

Yates County, N. Y.

The Rural New-Yorker has never spoken of this Vine as *new*. Though the roots are perfectly hardy, we have had the stems freeze to the ground during severe winters. We have also raised it from seed, but never had a seedling show variegation. While in the above particulars we differ from Mrs. Olin, we are glad to see that in other respects she more than corroborates what we have said in its favor.

The Poultry Yard.

LEGHORNS AND HAMBURGS.

About a year ago I started a yard of Brahmas. Tho' fine birds, I found them too heavy feeders, and their eggs large but not numerous. Wishing to start again with smaller eaters and "non-sitters," I write to inquire of you about Leghorns and Hamburgs. The American papers have a great deal to say of the Leghorn but the foreign books seem to speak of the Hamburgs as "every-day layers." Please enlighten me if possible from practical experience as to these breeds, also if not against your rules, where or of whom they can be had and how much I should pay.

C. E. Sprague.

An answer to your question has, through press of business, been unavoidably delayed. Your experience with Light Brahmas is the same as that of many other persons. Although they possess some very excellent qualities, they are not the most profitable, to keep in large numbers for eggs. Where a person has room to keep more active varieties, that thrive better on a large range, some other breeds are more profitable. In answering your enquiries as to which you should keep of the smaller breeds, you can best judge of your own taste and facilities.

I will describe the peculiarities of the two breeds you mention. American papers speak more of the Leghorns because they are peculiarly an American breed. They originated from fowls brought from the shore of the Mediterranean, but the improvements made on the original stock have been such as to make them appear entirely different birds, so they are called an American breed, and recognized as such in England. They are hardy, and lay a good-sized egg, and are deservedly popular.

There are three varieties, White, Brown and Black Leghorns. The first two are most widely known, the last differs but little from the Spanish. The White variety has been the longest established, and has proved a valuable addition to the farm, being good layers and their eggs large. The Brown are thought by most fanciers to be hardier than the White, certainly their plumage is richer, especially some strains that have very close-fitting, glossy plumage. They come to maturity much earlier than any variety of fowl, laying at a very early age, they are also prolific layers of eggs, rather smaller than those of the former.

Of Hamburgs there are five varieties, Silver-Penciled, Silver-Spangled, Golden-Penciled, Golden-Spangled and Black.

The great beauty of this breed, makes them favorites; their delicate markings and fine clean colors, of the gold and silver, show to fine effect on a lawn; a good flock, making a grand appearance with their sprightly movements, jaunty carriage and exquisite forms. They are always admired even by those who take but little interest in poultry, but their popularity for market purposes is somewhat injured by the smallness of their eggs. Where one wants to use the eggs, the Hamburgs combine not only the most beautiful of birds but best of layers.

The Black is an exception to others of this breed in size of eggs, theirs being large, they are also great layers; it is a little surprising that they are not more popular, as records of number and weight of eggs, for a given quantity of food, place them high in the list, as layers. It must be borne in mind, that none of the Hamburgs or Leghorns hatch their own eggs, therefore it is necessary to keep some other kind to hatch and rear the chicks. They also require plenty of room, or good care in confinement, or it stands to reason they cannot be every-day layers.

H. Hales.

BREEDING FOR QUALITIES.

In my last article in the Rural, Nov. 4th, on breeding for qualities, I made the assertion that not one single animal has been shown as the result of the crossing of two species of animals. I should have said not a single animal as the result of such crossing from a permanently maintained breed. Some closely allied species of fowls, such as *Gallus Sonneratii* and *Gallus Stanleyii*, have crossed with the domestic fowl, and a small number of their progeny have been fertile when again crossed with either of the *parent species* in the Zoological Gardens, London, and in India; but after a time they either became so sterile, or were so sickly that they all died out. *Gallus Bankiva*, however, readily breeds with the domestic fowl, and the offsprings are perfectly healthy and fertile birds. In plumage the *Gallus Bankiva* very closely resembles the black-breasted red game fowl; and the probability of this species having been the progenitor of all our domestic breeds rests on very strong presumptive grounds. Yet it matters not how long a time, even many centuries, may elapse, so true is nature to her laws, that she steps in and asserts her own prerogative so soon as human agency is removed, or man neglects to maintain the variety his care has brought forth.

This is very easily demonstrated in the case of Pigeons. No two fowls can be more unlike each other than the two varieties of pigeons, White Fantails, and Almond short-faced Tumblers. The fantail has been bred in India for centuries and was probably, thence, introduced into Europe: the almond tumbler has been bred in England many years; both of them are far removed from any resemblance to their blue rock progenitors. A few years ago I had an almond tumbler mate with a white fantail. They bred one pair of young ones that were white, with black and red patches. I gave them to a neighbor, and he bred them together. I called on him one day and he showed me the young ones he had bred from my pair, and to my astonishment they closely resembled, in color and shape, the blue rock pigeon. Finding he had always kept them confined, I was sorely puzzled to imagine what had brought about such a change, but having since read Teichmeier's work on pigeons the mystery is solved; as it seems proved beyond any doubt that all our domestic pigeons come from the common wild rock species, *Columba Livia*.

With all the variations of domestic fowls they do not seem to vary more than pigeons, if they do so much. A similar tendency is found in fowls to show certain feathers, and every breeder knows how difficult it is to keep out such intrusion. The nearer the varieties of fowls approach in color to the black-breasted red game, the more easily are they bred to feather. To begin with, take the Bantam: the B. B. red game is more easily bred to color than its next akin, the duck-wing game. I presume this is also the case with full-sized game. How many duckwings have inclination to brown on the wing! and olive duckwings are hard to breed with pure silvery hackles; yellow will keep cropping out to bother the breeder. The same thing occurs with Silver Gray and Dorking; cocks often have brown on the wing bar, and the hens are troubled with red on the wings. Dominiques, Plymouth Rocks, &c. when getting old are often inclined to yellow on hackle and back, much to the disgust of their owners. Brown Leghorns breed truer to feather than most varieties, and are hardier than the White. This seems to point to their origin, as most of the natural inclinations to color seem to be such as the game fowls show.

I have little doubt but that the art of breeding peculiar points is yet in its infancy. It is not many years ago that breeding for special forms and colors was hardly made a study of. Up to that time Hamburgs were all either Mooneys or Creoles; Polands had simply small top knots; Spanish were bred with small, white faces; Brahmas and Cochins were unknown; so were White and Brown Leghorns, Plymouth Rocks and many others. What a change has been wrought in a few years! What were then considered good fowls would not gain even a moments attention now. Every breeder knows that he cannot often breed good show birds until he has kept his stock, and selected and bred from them several times to ensure a strain that he can depend upon to breed true. The limits to which certain peculiarities can be carried to be useful, are better understood now than formerly. Very large combs on Spanish and Leghorns were considered as quite a wonder in breeding, and large combs were again and again selected until at last they became such monstrosities, that judges at fairs pass them by for birds with combs of more limited size. Where a monstrous comb is found the poor bearer feels it to be quite a load for his small neck, and he looks heavy and disconsolate under the weight of his ponderous burden. H. Hales.

INQUIRY ABOUT PHEASANTS.

I am contemplating the stocking of my country place with some Pheasants, not for the purpose of providing myself with shooting in the fall months, but to beautify my lawns by placing upon them some of these handsome birds. Can you tell me the best method of having them shipped to me? Can you tell me anything of the *Argus Pheasant?* I have been making some inquiries at the stores of some leading fanciers, and little seems to be known about the bird. You will oblige a reader of ten years standing, by giving me such information in the matter as you can. John A. Stimson.

Yonkers, Dec. 7, 1876.

Answer.—We are always glad to oblige our readers, and it is a double pleasure to be able to to do anything in our power for so old a friend. The Argus pheasant is a rare bird and we believe our correspondent will not succeed in stocking his place with this variety, for reasons which we will set forth in a future number. As we presume our reader of "ten years standing" is not contemplating the *immediate* stocking of his country seat, we will ask him to excuse our not answering his question at length, in this number that we may procure for him, and for the readers of the Rural, an illustration of this rare Pheasant. Meanwhile we beg him to accept our thanks for his ten years friendship, and assure him and all our subscribers that we will always be glad to hear from old or new readers, and feel happy to answer such questions as they may desire to ask in reference to home matters.

Pomological.

KEEPING PEARS IN WINTER.

Probably at no season of the year is this delicious fruit so fully appreciated and highly prized as during the winter and spring months. And yet how many unwittingly deny themselves nearly half the pleasure that the pear can bestow.

With a large number of those possessing orchards the season for this fruit ends with the entrance of winter, while, with *very little* trouble it might be prolonged many months. Two of the greatest enemies to the keeping of fruits in winter are the usually welcome elements—heat and air. Keep these away and the battle is won. The method to be followed is so simple that every one can practice it, and even at this date it may assist in keeping until spring, fruit that otherwise would very soon ripen.

Select clean wooden or pasteboard boxes, with or without covers, and line them with brown paper, though newspaper will answer. Then place two or three layers of pears carefully in the box—discarding all imperfect or bruised specimens, and cover with one or two thicknesses of paper. The pieces of paper should be somewhat larger than the box, so as to reach from side to side and keep out the air from above. One or two more layers of pears may be placed in the box in the same manner, being particular to have the top layer of paper quite large enough. Boxes one or two feet square will be found to be a very convenient size.

The boxes should then be placed in an unoccupied room or in an apartment of the cellar where the temperature of the air can be regulated at will. The thermometer should usually range from 34 to 40° above zero. If too warm then let in a little cool air from outside as required. Heat should be guarded against as it quickly causes the fruit to ripen. By this method many of the late varieties can be kept in excellent condition until the winter is past. I have had fine specimens upon the table in March and even during the latter part of April. By selecting several varieties, and bringing a few into a warm room to ripen it is easy to have ripe pears all winter long. Commencing with Beurre d'Anjou and Lawrence, the old-fashioned but delicious Beurre d'Aremberg will be welcomed as will also Josephine de Malines, Easter, Beurre and even the much abused Vicar of Wakefield.

The late keeping varieties of grapes, such as the Dianas, Catawbas may also be kept until the spring months in this way. The same plan will be serviceable in the case of apples using barrels or larger boxes. If a trial of this method is made, exclamations of surprise and pleasure that will greet you from admiring friends, as they see your tables decked with fruit in spring, will well repay you for the slight extra care that you may have taken.

Walden-on-the-Hudson, N. Y. R. H. Haines.

IMPROVEMENT IN THE QUALITY OF APPLES.

Not having a winter supply of sweet apples this year, the last week in November I purchased a barrel of Pound Sweetings. I found on testing them, whether raw or baked, that they had less saccharine matter in them than any I had ever before eaten; and in fact were so watery as to be quite insipid. I have a small empty chamber in my barn, and as the apples seemed to be rotting rapidly, I took all the sound ones out of the barrel and put each one on the floor of this chamber, so far apart that they did not touch each other. A few days after this the weather became so cold as to freeze the apples from a quarter to a half of the depth of their surface. I let them remain thus about one week, and then began again to use them, and found their sweetness so much increased, as to seem another sort of fruit, indeed now and then one almost equal to the Golden Sweeting Can any person give me the philosophy of this treatment in flavor and sweetness?

Had the apples shriveled at all, or shrunk in size, I should say at once that they had parted with some of their moisture, leaving all the saccharine matter within them; but such is not the fact; the apples are as large, and full, and smooth as when first taken out of the barrel. Can it be that the frost has more fully ripened and perfected them, thus acting like additional sunshine to our climate and longer hanging on the tree before being picked? I have kept the Golden Sweeting—an autumnal rather than a winter apple—spread out on the floor of a cold room, as above, till April, perfectly sound. They did not freeze during the winter, but they shriveled considerably, and were no sweeter in April than in the preceding November and December. A.

The Garden.

LIME FOR ASPARAGUS BEETLES.

SOME time ago I saw an article in the RURAL NEW-YORKER in regard to applying gas lime to asparagus for the purpose of killing the Asparagus Beetle. Will you inform me when it should be applied and the quantity?—J. MAHAN.

Either gas lime or freshly-slaked stone lime would probably not have much effect upon the Asparagus Beetle while it is in the imago or beetle state, but its larvæ are readily destroyed by such applications. The Asparagus Beetle hybernates during the winter, hidden in the ground or under any old rubbish about the place. In spring they come out, and so soon as the asparagus stems have appeared, the female beetles commence to deposit their eggs thereon. These eggs soon hatch, and the small, soft, blackish grubs therefrom may be found attached to the stems, branches and leaves of the plants. Now, this is the time to commence applying dry lime, dusting it over the plants. Any particle of the powder touching one of these grubs kills it. Gas lime, if it is thoroughly dried before applying, will probably answer the purpose. We have always used freshly-slaked stone lime for this purpose, and with the best results. If a second or third brood of the grubs appear on the plants later in the season, the dusting must be repeated.

Neighbors should all join in making war upon asparagus beetles and other noxious insects, else the efforts of a few persons may be rendered entirely ineffectual through the neglect of the many. If every person would destroy the insect pests which infest his own grounds, the expense of keeping any and all kinds in check would fall very lightly upon each individual. The lack of this "concert of action" is shown very clearly in the spreading of the Colorado Potato Beetle, which might have been kept within very circumscribed limits, near its native habitats, had the farmers of the West heeded the advice so frequently and freely given them by our entomologists.

A few thousands of dollars expended at the proper time in preventing the introduction or advance of insect hordes would frequently be the means of saving millions of dollars to the country; but the masses are either too ignorant to comprehend the importance of such precautionary measures, or stolcally indifferent to what may happen to their property some years hence.

DREER'S IMPROVED LIMA BEAN.

IN the RURAL of April 22, page 265, will be found, with an engraving, our first mention of this bean. A trial of it this season has not only confirmed our then favorable impressions, but convinced us that it is an "Improved" Lima Bean that, should it thrive in other sections as with us, will be planted to the exclusion of other Lima Beans, after one trial.

The pod is larger, rougher, wider and heavier. The beans are larger, more buttery in flavor, and there are more in the pod. In fact, the pod is as "full as a tick"—the beans crowding each other so as to flatten the ends and leave no intervening spaces. The vines themselves are extremely vigorous and prolific, and we believe the seed may be sown advantageously a little earlier than the time (middle of May) deemed advisable for other varieties. If facilities are at hand, we should advise starting them in small pots a month or more earlier and turning them out just so soon as settled weather seems probable.

This bean is the result of careful selection through many years, and, as was remarked in the notice above referred to, we know of no stronger evidence as to the importance of selecting seeds whatever the crop may be—than the superiority of this over other Lima Beans affords.

GEORGE B. LORING, in his Farmers' Club of Jotham, recommends small farms near large cities as the most profitable. Would it not be well also to recommend market gardening on remote farms?

Domestic Economy.

TO "ESTELLE."

Marble Cake.—For the white part, use one and a half cups of white sugar, half a cup of butter, half a cup of sweet milk, one heaping teaspoonful of baking powder, two and a half cups of flour, whites of four eggs. Beat the whites of the eggs to a stiff froth. Mix the baking powder in the flour. Rub the butter and sugar to a cream; add the eggs, milk and flour. Flavor with lemon extract.

For the dark part, one cup of brown sugar, half a cup of molasses, half a cup of butter, half a cup of sweet milk, one heaping teaspoonful of baking powder, two and a half cups of flour, the yolks of four eggs. Beat the yolks of the eggs very light. Mix the baking powder in the flour. Rub the sugar and butter together; add the eggs, molasses, milk, a little ground cloves and nutmeg, and the flour. Place alternate layers of the light and dark mixture in a baking-pan, well buttered. Bake in a moderate oven.

Chocolate Marble Cake.—One cup of butter, two cups of sugar, one cup of sweet milk, three cups of flour, whites of five eggs, one heaping teaspoonful of baking powder. Work the butter and sugar to a cream, add the milk, the whites of the eggs, beaten to a stiff froth; then the flour, with the baking powder mixed thoroughly through it. Take one teacupful of the batter and stir into it one large spoonful of grated chocolate, wet with a little milk. Fill the baking-pan about one inch deep with the white mixture; then drop in two or three places a spoonful of the chocolate batter, then a layer of the white; continue this until the mixture is all used. Bake in a moderate oven.

These recipes are very good. If any of the lady readers of the RURAL have better ones, will they please send them along for the benefit of "Estelle" and others. MRS. RUSTIC.

ORIGINAL RECIPES.

Graham Bread.—In answer to "Nina's" request, I send my recipe for Graham Bread. Not having tried Mrs. Rustic's recipe for bread, I cannot say that mine is any better, but I know that it is good Graham bread:—One cup of sour cream, one cup of buttermilk, one-half cup of molasses, one teaspoonful of saleratus, one teaspoonful of salt, and Graham flour enough to make a stiff batter. Put the mixture in a two-quart basin and set in a steamer and steam four hours.

I have some other recipes which I send for the benefit of the lady readers of the RURAL in return for their many good recipes:

Johnnie Cake.—One pint corn meal, two teaspoonfuls of cream of tartar, one teaspoonful of soda, one tablespoonful of sugar, a little salt. Mix altogether through a sieve; then add two eggs and one pint of sweet milk. Stir well and bake twenty minutes.

Fried Cakes.—One cup of sugar, one cup of milk, one quart of flour, three tablespoonfuls of butter, two eggs, three teaspoonfuls of baking powder, one half teaspoonful of soda.

Carbonate of Ammonia Cookies—One ounce of carbonate of ammonia, two teacups of sugar, one pint of sweet cream, flour enough to roll out thin.

Cream Sponge Cake.—Break two eggs into a teacup, beat well, then fill up the cup with thick, sweet cream; add one cup of flour, one teaspoonful of cream tartar, half a teaspoonful of soda.

Jelly Rolls.—Three eggs, half a cup of sugar, one cup of flour, one and a half teaspoonfuls of baking powder, the whites of four eggs, two-thirds of a cup of pulverized sugar, half a cup of flour, half a teaspoonful of baking powder, a little salt.

Cocoanut Cake.—Two eggs, one cup of white sugar, half a cup of sweet milk, a quarter of a cup of butter, one and a half cups of flour, one and a half teaspoonfuls of baking powder. Bake in a moderate oven in pans one inch deep.

To prepare the dessicated cocoanut, beat the whites of two eggs to a stiff froth, add one cup of pulverized sugar and the cocoanut, after soaking it in boiling milk. Spread the mixture between the layers of cake and over the top.

A FARMER'S WIFE.

Mrs. Bidwell's Sponge Cake.—Three eggs, one cup of sugar, even off one tablespoonful of cold water, one heaping cup of flour, one teaspoonful of baking powder. Bake fifteen or twenty minutes—not longer.

Spanish Cream.—Three pints of milk, one ounce Cox gelatine, six tablespoonfuls of sugar, beaten with the yelks of six eggs: this stirred into the boiling milk. Beat the whites and stir them in last. Flavor to the taste. Soak the gelatine in a little milk first; put into molds. Make the day before it is wanted for use.

Jumbles.—Two cups of sugar, one of butter, one of milk, four eggs, one teaspoonful of baking powder, flour to make it stiff enough to roll out, cut into shape and bake in a quick oven.

E. J. K.

COLORING RECIPES WANTED.

WILL some of the readers of the RURAL give me a good recipe for coloring cotton red, blue, brown and green? The cotton I wish to color is carpet filling. Also, how to make star candles? Please give the required recipes, as I need them.—MRS. M. F. JAMES.

Coloring Cotton Red.—Two pounds of redwood; boil this one hour, turn it off into a tub, put in four ounces solution of tin, put in the cotton and let it remain five minutes.

Coloring Cotton Blue.—Take two pounds of copperas, one-half pound of prussiate of potash, one-half pound oil of vitriol. Dissolve the copperas in enough hot water to cover the goods. Scald two hours. Take out the goods and rinse in cold water; then empty the kettle and put in fresh, soft water, sufficient to cover the goods well; add the prussiate of potash, put in the goods and boil twenty minutes; then take out the goods and to the liquor add oil of vitriol and stir well. Put in the goods again and let them remain until the color is as dark as desired. Rinse in cold water.

Coloring Cotton Brown.—To eight pounds of yarn take one pound of copperas and as much water as will cover the yarn; bring the water to a boil, put the copperas in and let it dissolve: then pour it out in a tub, put in the yarn and let it remain half an hour; take weak lye, as much as will cover the yarn, and bring it to a boil; take the yarn out of the copperas-water and let it air one-half hour; then put it into the lye one-half hour; repeat the process until the color is sufficient; wash well in hard water; then in hard soap-suds, soak one-half hour; afterwards wash in hard water.

Coloring Cotton Green.—For ten pounds of cotton carpet-yarn, boil in a loose sack four pounds of fustic for two hours. Take out the sack and add two ounces of alum. When dissolved, put in the yarn; keep it boiling gently one-half hour, stirring all the time. Then lift out the yarn, add to the water four ounces of indigo paste; stir well. Put in the yarn and stir gently for fifteen minutes. Leave it until cold, take out, rinse in cold water and dry in the shade.

If any of the readers of the RURAL can give a recipe for "star candles," will they send it along for the benefit of Mrs. M. F. J. and others?

MRS. RUSTIC

Hygienic Information.

POULTICES AND HOW TO MAKE THEM.

THERE are doubtless some skill and science necessary in making Poultices, consequently anything leading towards perfection even in these useful appliances is certainly worth disseminating. As there is some mechanical skill also required in their manufacture we were not at all surprised to find the following on the subject in the Mechanics' Magazine.

A poultice usually is only a desirable vehicle for imparting heat and moisture. By softening the tissues, poultices facilitate the passage of inflammatory products outward. The heat and moisture relax the tissues, and to that degree relieve the tension due to the inflammation, and to that extent relieve pain. The pain can further be eased by adding laudanum and such substances to the surface of contact of the poultice.

The materials best calculated to take up and give out the heat and moisture spoken of, are in common use. There must be enough of the mass to secure and retain enough heat to be of use, and therefore a poultice should be at least an inch thick. To prevent cooling in spreading, the cloth upon which the mass is to be spread should be laid out on a heated plate or dish, and the poultice, with not enough free liquid in it to "drip," rapidly and evenly spread over the muslin. A thin piece of quite old muslin should then be spread over the surface of the poultice, so the mass will not come into immediate contact with the skin. The spread area of the poultice should be just the size required; and the fabric upon which it is spread should extend beyond the edges of the poultice material, so that the unspread selvage can be turned over the edges of the mass. This will keep the poultice from leaking away.

After having been applied as warm as can be borne, a piece of oiled silk—or even oiled paper might answer—should be spread outside to retain the moisture, and something outside of that again to keep in the other useful feature of the poultice—the heat.

Such applications must necessarily be removed and renewed every little while. If poulticing is to be done at all, it must be done well, and that is, properly. A few hours of poulticing applied every half hour, will do more good than many hours of poulticing done in the usual way.

Bread and Milk Poultice.—Remove the crust from a piece of stale bread, and crumble the bread into a bowl. Pour on this enough sweet milk to cover it, and simmer over a fire, stirring it all the while until the bread becomes completely broken up. The poultice is now to be applied to the patient as warm as can be borne.

Flaxseed Poultice.—Take of flaxseed meal a sufficient quantity, and pour on it, little by little, enough cold water to make of suitable thickness. Then heat the entire mass. A small piece of lard is sometimes added to keep it from adhering to the part.

Yeast Poultice.—Mix a pound of linseed meal or oatmeal into half a pint of yeast. Then heat the mixture over a gentle fire, stirring carefully to keep from burning. When it becomes warmed through, it can be spread on linen like any other poultice. Yeast poultices are often ordered by physicians when there is a fœtid discharge from ulceration, which it is supposed to correct.

Bread-and-Water Poultice.—Take a slice of stale bread, carefully pare away the hard brown crust which lies around the edge, and then dip it into a vessel of hot water; lift it out at once, and if not too hot, apply to the part where it should go.

WOMEN'S CLOTHING.

THE London Examiner reads the women a lecture on clothing which we doubt if they will heed, still the truths told are, nevertheless, pertinent.

Of late there have been many signs that women, at last, are becoming alive to the strong control of clothes upon their fate. From time to time we hear of revolutionary associations instituted to free them from the weight of ruchings, and burst for them the fetters of Valenciennes and ribbons. Now it is a band of sedate English women who have pledged themselves to a convenient, if doleful, livery of perpetual black; now it is the patriotic and contrite ladies of Prussia who, under Imperial patronage, swear resistance to their too fondly obeyed tyrants and natural foes, the milliners of Paris; now it is a fiery squadron of American Amazons who are enrolling themselves to do battle with the hostile world for health, happiness and trousers.

We all find food for mirth in such associations, for we are agreed that dress is a trifle, and the idea of an association at all about such an indifferent matter, reminds us of the famous tempest in a teacup—and when trousers get into the discussions we laugh still more, because it is understood that the mere name of trousers is a capital joke. Yet, after all, there is something to be said for the women who "agitate" about their clothes. There is no doubt that the dress of Western women is cumbrous and, by its weight and the impediment it puts in the way of active exercise, a bondage; there is no doubt that it is unduly expensive, and there is no doubt that it sins nearly as often and as much against artistic, as against hygienic fitness. Raiment better adapted to the need, lighter to bear, more complete as a protection against vicissitudes of weather, allowing the whole body more play and, if one may dare to say it, less display, more lasting, and more graceful, is an improvement no sane observer can pronounce unneeded.

But a woman of the smallest self-respect, whatever might be her courage, would decline to adopt singly, no matter how rational and modest, a costume which could be a surprise to beholders; and no scattered missionaries, though looking never so comfortable and never so picturesque, could entice the female multitude to imitate their venture. If ever a material alteration is effected it must be by the union of many. Here is a difficulty at the threshold, for such union could ill be achieved except by the efforts of an association, and in such a cause the very name of association is a hindrance, suggesting suicidal parade and publicity over a reform in which of all others, an unobtrusive modesty would be essential.

Supposing that difficulty disposed of, the fatal difficulty is reached: What should the dress be? There is an old round which runs, "Let us be merry in our old clothes for we shall never get new." For want of the perfect dress to which a fairly representative woman's parliament could be got to agree, the sufferers under too much skirt will have a good many years yet in which to sing that chorus.

MANY people who have headache wrap up their craniums in wet cloths without thinking that, in ninety-nine cases in every hundred, the cause will be found in, and the remedy should be applied to, a lower portion the human anatomy, generally known as the stomach. This is the rebel against which constant guard must be kept.

PAST, PRESENT AND FUTURE.

THE closing of the year seems to be an appropriate period to glance at the past, study the present, and make preparations for the future. Regrets over that which has passed beyond our reach seldom add anything to our welfare or happiness, consequently it is time wasted to talk of what might have happened or been done if we could only have known, in advance, what has occurred within our past experience and present knowledge. The principal benefit to be derived from retrospective musings, is the detection of errors, which might again be committed with the same results were it not for the teachings of experience, which a wise person will consider as so much capital invested for present and future use. However much we may have lost during the year just drawing to a close, through negligence or a lack of wisdom, there is certainly nothing to be gained by carrying forward to the new account items likely to embarrass our movements, detract from our happiness, and fill a page in life's history with records of profit and loss which may increase instead of lightening our cares and labors.

Next week a new leaf is to be turned over in the record of years among Christian nations, and it is well to consider at this time what entries shall be made upon the new page. Shall forgiveness to all our enemies and those who may have done us wrong, purposely or otherwise, be one of them? Or will you carry forward the remembrance of wrongs, as though they were debts which must be paid in kind and, by so doing, put a blot upon a page which might otherwise have been so fair that none would blush to peruse it? Of course, we would not carry our charity in such things to that extent as to lead us into temptation, or association with those who are not to be trusted with our friendship or goods, for it must be admitted that mankind has not, as a whole, reached a moral standard which permits of one's placing confidence in every person with whom he comes in contact; consequently, in making up a list of friends and business acquaintances, it is well to drop the names of the untrustworthy from our books, and even memory, if possible.

Under the present condition of financial affairs, few persons can expect that their prosperity in the coming year will warrant the increase of personal or other expenditures, although there is no good reason for believing that "times" are to be any worse than now, while there is a fair prospect of a decided improvement. The country was never so rich as in this last week of 1876, no matter what the "croakers" may have to say to the contrary; and the present stagnation in business is not the result of poverty among the people, but of other causes which it is not necessary for us to explain, inasmuch as they are known to every intelligent reader of the RURAL NEW-YORKER.

Once more we say to our readers, close your accounts for 1876 by dropping from memory and record everything which in any way debars you from the fullest enjoyment of 1877; be industrious, practice economy, and this world will be found not half so bad a dwelling place as many a disordered brain would fain make us believe.

THE RURAL 1876—1877.

WITH this number closes the Twenty-Seventh Year of the RURAL NEW-YORKER. It is not for us to say, but for our readers to judge how well it closes, and how far our duties to subscribers have been fulfilled. Probably at no time since the starting of this Journal has more time, labor, money and care been expended in making the paper useful, interesting and correct.

To those who have failed to renew their subscriptions for the coming year, and to those whose names we have already received, we will say that we intend, not only to continue the good work, but to better it as much as possible. Correspondents who are new to the paper but old in their specialties, are constantly being added to our staff of contributors, while the old ones are continually finding something new to write about.

For the general and special farmer the RURAL each week contains hints and information suggestive of improved methods of conducting their business, any one of which will be worth to them more than the price of a year's subscription, while the Literary and Household Departments are to many people absolutely indispensable. As a newspaper the RURAL of course, cannot claim to compete with the mammoth dailies which few farmers can find time to read. Still, all the important events of the day are recorded in its columns, so that a subscriber who reads no other paper, cannot be behind the times.

To exactly suit all subscribers, we learned many years ago, is an utter impossibility, so that we have adopted the plan of doing as nearly right in the conduct of the paper as we can, and taking our chances upon the result. So far we have not been disappointed, and the numerous letters of praise and commendation of our efforts constantly received, which modesty forbids us to publish, almost compel us to believe that we are better than we actually are. We can only hope that such pleasing words of cheer are partially deserved, and then endeavor to deserve more.

COUNTRY SCHOOLS.

WINTER is the time in which country schools are generally more fully attended than at other seasons. The boys who have worked all summer, can now have an opportunity of attending school, doing the chores night and morning. City-bred boys know nothing of this, and while their advantages are far superior to the country boy for obtaining what is usually termed a good education, they make no better men, and frequently what they do learn, is not so valuable in giving advantages in the great struggle of life. But although our country schools are, upon the whole, excellent, still they might be made far better if their patrons or the parents of the children would take more interest in them—visiting the schools often and not only encouraging the teacher, but showing by their presence that the education of children is of sufficient importance to call for personal investigation.

Teachers often feel discouraged at the neglect shown them by the parents of the children under their care, and would do more, and take more interest in the advancement of their pupils if encouraged even by a word of thanks, or the slightest recognition. There must be some enthusiasm displayed in the support of the country school in order to have it an efficient and good one, and this must come from both parent and child; not from one side alone, because what the farmer calls a "spike team," (one horse constantly half a length ahead,) is not an easy one to drive, or the best to haul a big load. In addition to what is taught in books, it may often be well to introduce, in the way of diversion, some practical subjects which come up for discussion on the farm or in the household. This, of course, must depend somewhat upon the capacity of the teacher; for if he has no knowledge of botany, he would not be able to tell his pupils anything of the wood burned to keep them warm—or of coal, if the latter was used instead. Neither could he tell the farmer boy wherein rye differs from wheat or timothy from Hungarian grass, although this would be an interesting topic for a half-hour talk before farmers' boys. The same is true of all the other natural sciences; still, there are few school teachers at the present time who could not, if they tried very hard, obtain the required information if it has not been previously acquired.

If teachers generally had a better acquaintance with the natural sciences, they would be far more efficient in teaching children; for there is something in the history of any natural object—whether it be a stone, insect or flower—which, when pleasantly told, seldom fails to attract the attention of old or young. Those parents who may think they have cause to complain of their children not learning rapidly enough, or of their not taking sufficient interest in their studies the present winter, should look into the subject themselves, and see whether it be the fault of the teacher, the children, or themselves. There must be something to complain of all round; but if you never seek to learn the cause, you certainly have no one to blame but yourself.

RURAL NOTES.

Views in Rural Grounds.—We call the attention of our readers to the first series of sketches in the RURAL EXPERIMENTAL AND ORNAMENTAL GROUNDS, published on the first and fourth pages of this issue. They will, at least, serve to show that the trees, shrubs and flowers so often referred to in these columns as growing therein, have an actual existence. There is a great difference between writing from memory, and writing from specimens before one's eyes. We think we may say without exaggeration, that in these grounds are specimens at least of most of the desirable hardy plants in cultivation, adapted to this climate—and novelties from all parts of the world are being added from season to season. In Fig. 2, however, the engraver has represented the Hemlock Hedge as if it consisted of individual plants arranged closely together—when, in fact, it is so connected that one plant cannot possibly be distinguished from another.

Take Care of the Fire.—The daily and weekly papers teem with notices of fires in all parts of the country, which show that there are a great many careless persons in this world. To be turned out of house and home during one of these cold nights, is a thing not even to be thought of without a shudder; consequently, it concerns heads of households to see that everything about the heating apparatus of their homes is made safe and secure against such an occurrence.

Milk in New York.—During the past week thirty dealers in milk have been on trial for watering the milk furnished to their customers. One pleaded guilty and was fined $50, while the others combined and stood trial, in order to test the case, and see if adulterating milk with water is a misdemeanor before the law. Out of the one hundred and twenty millions of quarts of milk sold in this city and Brooklyn, at least forty millions are water, and consumers thus pay four millions of dollars annually for water. Men who have become so depraved as to desire to make money by robbing babes and children, should be declared outlaws, and have meted out to them the punishment their crime so richly deserves.

More Corn.—The Patrons of Husbandry have accomplished at least one good thing. At the National Encampment in 1874 (we think) a suggestion was made and discussed relating to the dependence of the Southern States upon the North-west for their cereals. The Southern planters were advised that it was much cheaper to raise their own corn. This discussion was published and copied in the agricultural and country papers generally, and we now see by the report of the Department of Agriculture that the corn yield of the Southern States in 1876 exceeded that of the preceding year 10,000,000 bushels. It would hardly be possible or advisable that corn should supplant King Cotton in that section, yet this evident approach to self-sustenance will be found of great benefit.

Planting Potatoes in Autumn.—A Belgian writer says that the potato being a perennial plant, the tubers should be put into the earth in the fall instead of spring. But we fail to see the advantage of fall planting over that of spring, inasmuch as no growth could take place during the cold weather. We know that fall planting of potatoes has been practiced to some extent in the United States, but with not very satisfactory results, especially in the Northern States, although there may be some satisfaction in knowing that such things can be done.

The Starving Poor.—If our Southern contemporaries who sympathize with the starving poor of our Northern cities, would only try the experiment of getting a few hundreds to go South and work on the plantations, we think they might get their eyes opened to at least one of the causes of so much poverty and distress among a certain class. There is a fascination in city life which the greatest poverty and want cannot dispel.

RURAL BREVITIES.

OVER 1200 persons died of yellow fever the past summer in Savannah, Georgia.

CASTOR BEANS, although extensively cultivated in Missouri, are quoted at $1.90 per bushel at the factories against $1@1.25 last season.

UNDER "Floriculture," we refer to Professor BEAL'S article, "Bee Flowers," as being published in another column. It was crowded out, but will appear next week.

THE new flouring process, of which so much has been said of late, is merely the putting of the very old process of pounding corn in a mortar into use on a larger scale.

A MAINE farmer says that he can raise and market potatoes at a cost of less than sixteen cents a bushel. According to this calculation, those who have had a good crop this year will make money.

THE Faucier's Journal, which has heretofore been published WEEKLY will, after the first of January, 1877, be issued MONTHLY. Want of support is the reason given for the change, which is a pity for so excellent a journal.

AMONG the novelties in the housekeeping line we notice the Climax Wringer advertised by N. B. PHELPS of Chambers St., New York. They claim that it works with only half the labor of ordinary wringers, by means of purchase gears.

"TOO many fences," is the cry now-a-days with quite a numerous class of agricultural writers; but we opine that if they had some men for neighbors, they might wish there were more fences and all of them higher and stronger than now.

MEN in England who own land do not want to sell it, because of the position which ownership of real estate enables them to hold; and those who do not own land, prefer to invest their capital where it will bring them a better return, say in cattle and fertilizers, consequently both classes are satisfied, with the present disposition of landed property and tenants.

THE old farming lands of Maine are said to be nearly or quite worn out; besides, the summers are short and the winters severe, still we hear reports of more than one hundred bushels of corn having been raised per acre in the State the past summer, which show that the northeast corner of Uncle SAM'S farm is worth something yet.

IT has been claimed that the Western Locusts would not eat the Castor bean plant, consequently farmers in the infested regions could grow this crop with impunity, if no other; but it now turns out that while the locusts do not trouble the leaves, they eat the flowers off, thereby preventing the production of the beans, which is just as bad as though they ate up the entire plant, especially if the "hoppers" came during blooming time.

GOOD-BY, OLD YEAR, GOOD-BY.

BY GERALDINE GERMANE.

THE bells ring slow, in muffled tone,
The chilling wind makes sadder moan;
The flowers are dead and all must die.
Good-by, Old Year, good-by.

The laughing streams run coldly now,
Stern Winter reigns, with ice-crowned brow,
Fair Summer is dead and you must die.
Good-by, Old Year, good-by.

Once you were young but now you're old,
Our youth can ne'er be bought with gold:
Your youth is long dead, all youth must die.
Good-by, Old Year, good-by.

Your glory came, your glory's gone,
All glory fades, Time breathes upon,
All grandeur and pride shall surely die.
Good-by, Old Year, good-by.

You brought as many glil'ring joys
That cloyed and broke like children's toys,
Our joys you have killed, now you must die.
Good-by, Old Year, good-by.

You brought us much of galling grief,
But, like our joys, its smart was brief,
If Joy must aye die, then Grief must die.
Good-by, Old Year, good-by.

Thou wast a year of hundred years,
Of glorious triumph that endears,
But, ah! as the others, thou must die.
Good-by, Old Year, good-by.

Though husk must die the kernel lives,
So doth the truth each year e'er gives;
Thou brought'st us much that will not die.
Good-by, Old Year, good-by.

The Story-Teller.

THE MAIL-GUARD'S STORY.

READER, have you ever been obliged to wait at a small country railway station for an early train? If you have not, you have not experienced the *ne plus ultra* of human misery. But when, as was my case last year, you have left a jolly party, driven five miles to catch the mail at 2 A. M., and found, on your arrival at the station, not that the train had gone, for that would be a relief, but that you had mistaken the time, and had got three-quarters of an hour to wait, your lot is not an enviable one. So I thought as I stamped up and down the ill-lit platform, and gazed into the darkness beyond, which was only broken by the dim and misty light of the "distance" signal, some hundred yards down the line. The occasional barking of a house-dog alone broke the stillness, except when now and then the autumn breeze played in a wailing tone on the telegraphic wires over my head. As I paced up and down to warm my feet, I felt regularly "savage" that the well-meant solicitations of the company assembled at the Beeches had induced me to forego that last waltz with Minnie Cameron, and hurry to the station.

I had been staying for the past fortnight at the house of a relative, and what with shooting, fishing, and (must I confess it?) occasionally flirting with the blue-eyed Minnie, the days had passed rapidly; and when recalled to London by my father's business-like letter, which hinted at some impending calamity connected with our firm, I could not believe that my leave had so nearly expired. There was no help for it, and go I must. My relatives appeared as sorry as I was when I announced my intended departure, and I fancy I could discern traces of tears in Minnie's sunny eyes as I bade her farewell in the hall that evening, bearing with me a shining tress of her flaxen hair, and a hasty kiss, as *souvenirs* of my visit. Oh, Minnie, Minnie! what would that excellent man, the incumbent, think, could he have seen the shining token of what I fancied was your affection for me, lying on my table prior to its being committed to the flames, with a bundle of old letters, when last month I heard you were "engaged?"

Under such circumstances as I have described the reader will easily imagine I was not in a particularly cheerful frame of mind on the night, or rather morning, in question. I sauntered into the dreary waiting-room, and, lighting a cigar, seated myself in front of the expiring fire, which I was even denied the amusement of stirring, the authorities having carried away the fire-irons. Placing my feet upon the fender, I lay back in my chair, and, as most men would have done, I began to ruminate upon the events of the past fortnight, and—Minnie! After a time I roused myself, and attempted the perusal of my father's letter, and then—I fell fast asleep. How long I slept I cannot say, probably about five-minutes, but it seemed an age, when I was aroused by the creaking of the "breaks" of a train. I started up, and rushed blindly to the door, fancying that the mail had come up, when I came in violent contact with a guard, who was entering at the same moment as I was making a hurried exit.

"Beg your pardon, sir," said the polite official; "what is the matter?"

"My train is going, I think," said I. "Let me see."

"It's only a down goods and cattle, sir," replied my companion, "which shunts here. The up-mail ain't due for nearly twenty minutes yet."

"Confound it!" I muttered; "why did it wake me, then?" and I returned to the fireplace.

"Cold night, sir," remarked the guard as he came towards me.

"Yes," said I, "and a wretched fire, too."

"I think we can mend that, at any rate," he replied; and, leaving the room, he returned in a few minutes, accompanied by an individual whom I rightly conjectured to be the stoker of the "goods" train, carrying a large shovelful of live coals, which, placed upon the cinders, soon improved our fire, and gave quite a cheerful aspect to the dingy apartment.

"Thank ye, Jim," said the guard as the stoker departed. "Now, sir, that's an improvement, ain't it?" he added, cheerfully.

"It is, indeed," I replied; "and I am much obliged to you for procuring the coals."

"Don't name it, sir," was the reply. "One must do something when one has to wait, you know."

"How long do you remain here, then?" I asked.

"Till 3:40, sir, I take up the mail," was the reply.

"Oh, indeed," said I.

"Yes, sir. I'm on this job all this month." And as he spoke the guard drew a pipe from his pocket, and having filled and lit it, he began to smoke in silence.

"Have you been long on this line?" I asked, after a pause.

"Well, sir, about three years, and on the mail duty, on and off, about one. I'm a reg'lar man of letters," he added, with a grin.

I laughed, and he continued.

"I was nearly choked with a capital letter when I was a baby. I had letters on my collar when I was in the police. I was made a guard all along of a bit of a letter. And now I am a guard, I looks after the letters." Having made these remarks in a jocular tone, my companion gave me a knowing nod, and puffed away at his pipe with greater vigor than before. I was much amused at his rejoinder, and asked him what he meant by having been made a guard "all along of a bit of a letter."

"I wasn't always a guard, sir," he said. "I was once in the police, and it was through being a detective as I got to be employed on this line."

"I suppose you didn't like the police, then?" said I.

"Well, sir, not much, though at times it was pretty good, and we had some jolly business. Ay," he continued, "with a good scent it's almost as excitin' as fox-huntin', is thief-catchin'; for some of those fellows is as cunnin' as foxes, every bit.

"It was through a robbery and a bit of paper that I was made a guard, as I said just now."

"How was that?" said I, catching at the idea of a story to beguile the time. "I should like to hear a bit of your experience as a detective."

"It ain't much of a story, sir, but I'll tell it to you with pleasure," and taking a few rapid puffs at his pipe, the guard commenced.

"It was about two years ago, and there had been a great plate robbery in the city, and the thieves had got clear away, so we was all obliged to keep our eyes open and our wits about us, for, though we had some suspicions, there was no real clues to go upon; it was mostly guess-work. Two or three men was arrested, but nothing was ever proved against them, so they was let go, in course. Nothing ever transpired respecting the robbery, and it was almost forgotten, except by some of us detectives, for a reward of $500 had been offered, and we was, in course, anxious to catch the men, as well for the credit of the force as for the money, which, sir, was not by no means to be despised. Well, sir, I wasn't half satisfied about one of the men who had been arrested, and whose name was Dover. He and and another was always together, and we in the force nicknamed them 'Chatham and Dover,' in consequence. We had 'Chatham' (whose real name was Byles) up too, but nothing turned up. However, one night after the business had blown over a bit, I thought I'd have a look after Dover; so I goes to where I was sure to find him or his 'pal,' in an out-of-the-way place near Field Lane. When the door was opened, I saw as the woman was a new hand, and didn't know me. So I asked if Dover was in. 'No,' says she, 'he's gone out of town.' 'In which direction?' says I. She pointed upwards, which meant north. 'Indeed,' says I. "Well, tell him as Mr. Moss wants to see him as soon as he returns'—makin' a shot, sir. I was at a man as I suspected was a 'fence,' and who I had my eye on. 'All right,' says she, and shuts the door.

"Thinks I, I've not done a bad stroke of business this evening. Mr. Moss and I will settle our little account now; so I went quietly home. Next afternoon, just after dinner, a message comes from the —— Bank for Mr. T——, our inspector. Telling me to be ready in case of bein' wanted, off he goes, and in about an hour he came back and said, 'We've got a job to-night,' he says, 'for a party has wrote another gentleman's name by mistake, and bolted with a large sum of money and his young woman, as is supposed, to America.' We had to start that evening by the nine o'clock train for Liverpool, which we did, and arrived there about four the next morning. We immediately put ourselves in communication with the local authorities, and searched several outgoing ships, but without any success. Just as we were leaving one of the vessels, the captain said to me, 'It's a pity you didn't know a little sooner, for an American barque sailed yesterday's tide for New York.'

"'The deuce it did,' says Mr. T——.

"'Yes,' says the captain; 'and you may depend upon it your man was off in that vessel.'

"'We're done, then,' says Mr. T——, 'and will have to go back with our labor for our pains.'

"'Well,' says I, 'I don't see that, by no means. When does the mail go?' I asked the captain.

"'It's gone,' says he; 'went last night.'

"'That's no good, then,' says Mr. T——. And he was very angry at bein' done.

"'I think, Mr. T——,' I says, as we walked away, 'I think we can catch him yet.'

"'How?' says Mr. T——.

"'Why,' said I, 'let us take the mail steamer to Dublin this afternoon, and go by the mail train to Queenstown! we can catch the steamer there, and pin your man in New York.'

"'I declare, we will,' says Mr. T——; 'that's a good idea; only I'm afraid I shall have to go alone, for you will be wanted in London, you know, next week.'

"I had forgotten that, and was very much disappointed at not being able to accompany Mr. T—— to New York.

"'However,' says he, 'I'll not forget you when I come back.'

"And in order to arrange our plans and have some breakfast we returned to the railway station. Well, I saw Mr. T—— off for Holyhead and felt very much annoyed at not being able to go with him, though, had I known it was the best thing that ever happened to me, I shouldn't have felt so sulky, you may depend. As the boat left the landing-stage, I turned into —— Street and walked about a bit until I saw a great crowd opposite a jeweler's shop. 'What's up?' thinks I; 'anything in my way?' So I asks a bystander, and he told me that an immense amount of jewelry had been stolen the previous night and there was no trace of the robber. 'Ho, ho!' I thought. And I asked to see the owner of the shop, and telling him who I was, I requested to see some traces of the thief's work—for, sir, some men work in exactly the same way at all their 'cracks' and you can tell their 'handwriting' after a bit of practice. I therefore examined the place and, as I suspected, found that this robbery had been done in a similar way to the one in London. For it had occurred to me that Mr. Dover had not left London for nothing, and now I was pretty sure that he and his 'pals' had done this job as well. After making my inspection and asking the proprietor to say nothing about my visit, I returned to Lime Street station. I then found that I could return to London by a slow train at 1 o'clock, which, as I had nothing to do in Liverpool, I preferred to take rather than to wait for the 3.45 express. I was in much better spirits now than I had been, and as I entered the train I made up my mind to look after Dover in London, whither I never doubted he had returned, for of all hiding-places, sir, London is the best. So I made myself as comfortable as possible. Nothing happened till, as we were nearing Stafford, a bit of paper was blown into my face; and as I, out of mere curiosity, stooped to pick it up from the seat where it had fallen, two other and larger pieces came in and fell on the floor.

"There was no one else in the compartment, so I put the scraps together, just to see what I could make out of them, and to my astonishment I read:

"'I will be at 2 o'clock, you do it.
"'I. DOVER—
—Good time.'

"That was all. The last words, on the smallest bit of paper, I didn't care for; but the other parts made my heart jump when I read them, for I made sure that I should now catch Mr. Dover for the robbery at Liverpool. The instant the train stopped out I jumped, and began looking into the carriages as I passed, pretending I had lost something.

"At last I came to a carriage near the engine (a second-class), on the flooring of which I could see several bits of paper, and upon going on I found (for the carriage was empty) an envelope, addressed to some place in Camden Town, in the same handwriting as was on the bits I had.

"While I was examining the envelope, I saw three men coming from the refreshment-room in the direction of the carriage, so I seated myself in a corner next the door and shut my eyes. I was more than ever convinced that I had now got a clue to the Liverpool job, and I determined to keep my eye on the former occupants of the carriage, who now returned to their seats.

"The smell of rum which pervaded the compartment, convinced me that they had been indulging pretty freely, and while they were in earnest conversation I opened my eyes, and sitting nearly opposite to me was Dover himself; the other men I did not know. Before the train got to Rugby they were all fast asleep; and as soon as we stopped out I jumped, and left them still snoring."

"You went for assistance, I suppose," said I.

"No, sir," replied the guard, with a knowing wink, "I wanted them in London, not Rugby; for, ye see, by keeping the train I might have excited suspicion, and my birds might have flown. No, sir; London was their destination and I could catch them on their arrival."

"Well," said I, "but you left the train, you say."

"I did, sir; for it occurred to me that the 3.45 up express from Liverpool was due, and I knew that it left Rugby a few minutes before the train in which Dover and his friends were. Just as I got out and had shut the door, I had the satisfaction of seeing the train shunted, to make room for the express, which came up a few minutes after. I was soon on my road to London, where I arrived about 9 o'clock.

"I had just an hour and a half to make my arrangements, and while my men were quietly 'jogging along' near Tring in the slow train, I was soon in possession of the necessary authority and taking two of our men with me, I returned to Euston Square.

We had to wait some little time, but the train at last arrived, and I led the way to the carriage in which I had left Dover and his associates. They were just getting out as we reached them, and a gentle grasp on the collar, and a word in the ear soon reduced them to a terrified silence. Their baggage was also seized, and in a portmanteau was found a quantity of the jewelry which had been stolen in Liverpool.

"We had them up next day and they were fully committed. At the trial, one of them turned evidence, and by those means the city burglary was proved against them. The rewards were paid over to me after the trial, and I was very much complimented by the judges on the manner in which I had managed the capture."

"I think you quite deserved the rewards," said I; "but what became of the inspector?"

"Oh, Mr. T——, sir. He went across, as I had told him, by the mail from Queenstown, and got to America the day before the ship in which the forger was.

"He boarded every ship, and from the description he had received he caught him afore he went on shore. There was no doubt about him, for some of the identical notes which had been issued in London were found upon him.

"Mr. T—— didn't bring him back, sir; he only took possession of the money; for he thought it would cost more to bring him home and prosecute than to leave him where he was. The bank gentleman said he was quite right, and gave him $250 for his trouble. When he returned to England, one of the directors of the bank, who is our chairman, sir, was complimenting Mr. T—— upon going to Ireland; and then Mr. T—— spoke up for me; and knowin' as I didn't care about the force, he told the gentleman so, and he, after a time, offered me the place I have now, with a prospect of "a rise" if I behave myself. So you see, sir, it was, as I said, all through a bit of a letter as I got to be a mail guard."

"I am very much obliged to you," said I, "for your narrative; it has amused me very much indeed."

"I am very glad to hear it, sir," replied the ex-detective. "and (you'll excuse me, sir)—but I think as I've seen you afore."

"Very likely," said I, laughing; "your experience has doubtless led you across my path."

"Ay, I thought as much, sir," said the guard; "I see you when Mr. —— offered me the post I have. I remember you was a comin' in as I left the bank."

"I dare say I did, for my father sees a great many people at the bank," said I.

"Is your father Mr. George Somerville, as lives near H—— when he's at home, sir?"

"Yes," said I; "I have just been at my uncle's house now, and am on my way to London, where my father is at present."

"Well, that is curious, sir," said the guard, touching his cap, "as I should see you here this evening, and I'm proud to have met you, sir."

I replied, and the guard running to the door, exclaimed, "Here's the mail, sir; if you'll show me your things I'll see that they are all right." And once more touching his cap, he withdrew. The mail soon drew up and having been comfortably bestowed by the guard, as we "spun" over the distance that lay between S—— and the metropolis, I pondered on the singular story I had heard until I fell into a doze, from which I was not thoroughly awakened until the train stopped "to take tickets."

We were soon afterwards run into the station; and as I stepped out of the carriage, I found the guard ready to assist me. He soon extricated my portmanteau from the heap at the end of the platform, and insisted upon carrying it to the entrance of the station for, strange as it may appear, there were no cabs in attendance that morning. As we emerged into the street a Hansom drew up close to the departure entrance, and the guard hailing John, we waited until the fare had alighted. What was my astonishment to find that the gentleman who was about to take his departure thus early from London was no other than my father's confidential clerk, respecting whom my father had already communicated his suspicions in the letter I had received the morning before. I started involuntarily at the sudden appearance of the very person whose affairs I had come to London to investigate, and followed his retreating figure with so earnest a gaze that the guard, who had been observing me closely, said:

"Beg pardon, sir; do you know that gentleman?"

"Certainly I do," I replied; "I've come up on his account; Mr. Barton is my father's confidential clerk; but I'm afraid all is not quite right," I added, thoughtfully, and in an undertone.

"I suspect there's a little game," said the guard; "the man as is gone in there was called Byles three year ago."

I was struck with astonishment at this remark, and asked my companion if he were certain that the *soi-disant* Barton was in reality Byles, *alias* Chatham.

"As certain as I stand here," replied the guard "and take my word for it, sir, he's after no good. If you don't think me presumin', I should like to hear what's up."

"Well," said I, "the matter is a confidential one; but I may tell you that we have reason to suspect that Mr. Byles' accounts are in a most unsatisfactory state. Can we not intercept him, for I think he intends to bolt?"

"We shall soon see that, sir," replied the guard, his detective nature showing for a moment; "he will be easily caught, I reckon;" and as he spoke the ex-policeman led the way to the departure platform.

Here, amid the crowd of people who had taken their tickets and were struggling to enter the different carriages, it was no easy matter to recognize Mr. Barton, who had, doubtless, his own reasons for eluding observation; and it was not until five minutes prior to the departure of the train that I observed him ensconced in a corner of a third-class carriage.

"Good morning, Mr. Barton," I said; "you are off early to-day."

The person addressed changed color as he recognized me; but immediately recovering his self-possession, replied:

"Yes, sir. Mr. Somerville wished me to see C—— & Co. respecting those bills we hold, as soon as possible, and I am on my way down."

"But they are all right," I said, "for my father told me so last week."

"Yes, sir," said the clerk; "but my mother's very ill—dying, I fear, and as Mr. Somerville kindly told me to go down to F——, I said I'd do the bills too." And having given vent to this contradictory speech, the clerk blew his nose violently.

The cool way in which this was said and the curious looks of the other occupants of the compartment at any other time would have quieted my suspicions; but a gentle touch on the arm reminded me of the presence of the guard, and I therefore said loudly, "Oh, you are going to F——."

As I spoke, the guard said suddenly, and touching his cap respectfully, "Beg your pardon, sir; did you say you was going to F—— ?"

"No," I replied; "but this gentleman is," indicating Mr. Barton as I spoke.

"Very sorry," continued the guard, "but he can't go by this train; he must wait for the Parliamentary at 8.05. Tickets, please," he added, suddenly opening the door. All the tickets with the exception of the clerk's, were immediately produced. "Now, sir, your ticket, please," said the guard. Thus brought to bay, Byles *alias* Barton, had no alternative; so he handed the guard his ticket, and suddenly rising attempted to leave the carriage, but the detective was too quick for him. Before the clerk's foot had touched the platform, a grasp was laid upon his collar and the carriage door closed. "I thought as much," said the guard, as he looked at the ticket, holding unhappy Barton the while; "I thought so. Going abroad was you, sir; but *I* want you for a moment."

He then, asking me to open the door, again descended from the carriage, forcing Barton to follow him; when, having gained the platform, he whispered a few words in his ear. The man grew as pale as death, exclaiming, "I never did! I swear I never did!"

At that moment the whistle sounded, and with a hiss and a scream the train moved away. Life, liberty, hope—all seemed to fade from the unhappy wretch as the carriages passed him, and with an almost superhuman effort he wrenched himself free from the guard's grasp and attempted to open one of the doors of the departing train. Cries of "Stop him!" were raised by the spectators, while the guard hurried in pursuit, but his efforts were of no avail.

Before any one could seize the fugitive his foot had slipped, and still clinging to the handle, he was carried along for a few yards and then dashed between the platform and the now rapidly moving train. A despairing cry and a deep groan were heard even above the rattle of the wheels, and the train passed on, leaving the mangled yet still breathing form of the unfortunate clerk stretched across the rails.

Assistance was immediately procured. But it was of no use; death soon put an end to his sufferings; but before he died the unhappy man confessed his guilt to me and asked my pardon. It appeared he had been induced to embezzle sums of money to repay losses at play with his old associates, and he had thus been led to return to a path of life which he had intended to have quitted for ever when he entered my father's business. He had contrived to possess himself in all of about $30,000 in bills and notes; some of which, to the value of $10,000, were found upon him. The remainder had been made away with and was never recovered.

Having made such arrangements as were necessary I left the station, and proceeded home to communicate to my father the tragical termination of my journey, when I found he had already taken steps for arresting Barton on his appearance in the city, circumstances having arisen which placed his guilt beyond question.

My father was much moved and interested by the details of the death of his unhappy clerk and by my recital of the circumstances of my meeting with the guard, who had fully repaid the interest my parent had formerly taken in him.

The fortunes of our house soon recovered the blow which the misguided Barton had managed to inflict upon our credit, and I consider the prosperity of the firm of Somerville & Co. is due to my accidental meeting with, and the story told me by the mail-guard.

KEEPING ON.

Two boys sat together one Tuesday evening in a large meeting of children. Their names were Thomas and Philip. They both listened attentively to a gentleman who was speaking to them. This gentleman explained that all who liked to do so were invited to make toys or models, or any other articles, for an exhibition which would soon be held.

"Of course," said the gentleman, "the best articles will receive the best prizes; but all that are well made will be exhibited. And even if you are unsuccessful in your endeavors to gain prizes your labor will not be in vain. All who please may have their articles sold; and it is a pleasant thing for boys and girls to receive money which they have themselves honestly earned. And though you should receive neither money nor prizes, you will yourselves be the better for the efforts which you have made. So I advise you all to do your best for the forthcoming exhibition. Even the youngest may do something, and it only needs patience and perseverance on your part to make the whole thing good and delightful."

"Shall you do anything, Philip?" inquired Thomas.

"I don't know," said Philip. "I think I shall try."

"You think you will try!" said Thomas. "Well, that is cool after what has been said. I shall do lots of things and carry off some of the best prizes."

"How do you know that?" inquired Philip.

"Oh, I am sure I shall. I have thought of a dozen things which I can do. I shall make a model of our school-room in cardboard. I shall make a velocipede with a boy on it, and a wooden apple painted like nature. And I shall draw some maps and send some specimens of handwriting. I shall also make a collection of postage stamps; and I shall make some chairs and tables which can be sold for toys, and they will fetch a good price, for I shall polish them up beautifully."

"If you do all that, Tom, you will indeed do well."

"I shall do it all. There is no fear but that I shall do my part for the exhibition. Now what will you do?"

"I really do not know. I must think about it first and decide what I can do best."

"How many things do you think you will do?"

"Perhaps only one. Certainly not more than two."

"You are not like me."

"No; I am sure I should not have time to do half the things you have mentioned."

"I shall begin at once."

So he did. That very night, after he got home, he sat up in his bedroom in the cold; and by the light of a candle cut several sticks with his penknife.

The next day he was up quite early in the morning working away at chess-men, and he begged his mother to let him stay away from school that he might begin his card-board model.

He had spoiled one sheet of card-board and commenced upon another; he had also littered a number of chair-legs and table-tops on the floor and collected three postage-stamps, when he decided to see how "slow-going Philip," as he delighted to call him, was getting on.

"Well, Phil, what are you going to make?"

"I am going to make a model coach."

"Oh! then you have made up your mind at last."

"Yes, I have decided to do that, though I know it will take some time to do it. Indeed, I shall have to stick to it well to get it done in time."

"Have you begun it yet?"

"No. I am not going to begin it until next week. I want to get forward with my lessons first, for of course it will not do to neglect the old work for the new."

"I have begun nearly all my things."

"Have you? Now, I should not begin a second thing until the first was quite finished."

"Wouldn't you? But then you are so different. I enjoy variety."

"Well, my way is to do one thing first."

"And the other is mine. We shall see which answers best. I think I have begun well."

And so he had. But it is not so much the beginning as the keeping on which succeeds in the end.

Thomas worked as diligently as Philip all the first part of the time. Indeed, I think that of the two boys he did the more; for he got up early and sat up late and thought of very little else.

And then he grew tired.

One day he did nothing to any of his articles.

The next day he looked at them.

"It is very discouraging," he said to himself. "Those wheels will not turn round properly, and I shall have to take them all to pieces and try again. But I will not trouble about it to-day. To-morrow I will set to work at the velocipede."

On the next day he found it was still very difficult.

"Never mind," said he to himself. "I will lay it on one side and do something else."

The same thing occurred with several of the articles, until at last he grew disgusted with them all and shut up the unfinished things in a cupboard, out of sight.

"When I have had a rest," he said, "I shall take them out again and set to work with a fresh interest."

Meanwhile Philip kept steadily on. He found that there were many very uninteresting things to do. But though he was sometimes tempted to leave the work and go out to play instead, he always made himself do a little of it every day. The consequence was that it gradually drew more and more beautiful until, at last, nearly a fortnight before the exhibition was opened, it was quite finished, and all who saw it declared it to be perfect.

"I have not seen anything of Tom. I wonder if he has finished his articles," he said to himself on the next day. "I will go and see, and remind him that he has not much time."

Thomas was out when he went, so he called again.

"Tom, the exhibition will soon be opened. Are you ready?"

"Ready? Well, no, not exactly, though some of my things are pretty forward and will not take very long to finish."

"I would finish them at once then. It is never well to leave things to the last minute."

"Have you completed your coach?"

"Yes; will you come and have a look at it?"

Thomas was a little astonished at what he saw.

"I should not wonder if you got a prize after all, Phil," said he. "What pains you must have taken with it."

"Yes; I did every part as well as I possibly could."

"I shall go back and set to work again directly."

"Do so. I am sure it is not safe to lose any more time."

Thomas did several things that day. He fastened two sets of legs to the chairs and cut the chimney in the card-board school.

On the next day, however, something else occurred which drew off his attention, and so the work was neglected.

About a week afterwards Philip called on him again.

"Tom, I have sent my coach in. I thought I would remind you that to-morrow is the last day on which the committee will receive articles for exhibition."

"Thank you, Phil."

"Are yours finished?"

"No; I shall finish them directly."

He tried then when it was too late. So much remained to do that he possibly could not do it in the time. He had finished nothing until the day after all the things had been sent in.

Then he took what he had done to the secretary.

"It is too late," said he. "Did you not know that yesterday was the last day?"

"Yes, sir; but I could not get it finished in time."

"You should have begun earlier, my boy."

"I began on the first day sir."

"Ah! then you have not kept on."

That was true; and it lost Thomas the chance of getting a prize. A first prize was awarded to Philip, and he received much praise for his work. And yet I do not think that he was at all more clever than Thomas; only the one persevered and the other did not.

If Thomas does not change, this dislike to keeping on will spoil his whole life.

The Literary World.

RECENT LITERATURE.

Books for Holliday Presents.

The Farm Yard Club of Jotham. By GEORGE B. LORING. Boston: Lockwood, Brooks & Co. (Oct. Cloth—pp. 603. Price $3.50.)

THE author's estimate of farming can be readily obtained by the following extract from his Preface:—"It is not the mere possession of land which has, in all ages of the world, made an agricultural people strong and enduring; but it is the sturdy characteristics and ardent attachments growing out of such possession which constitute that vital force of a nation so much admired by the careful observer and student of history. And it has been left for us to prove that an independent and responsible community of small landholders, living in a land of social and civil equality, and tilling their own soil, stands foremost among those who are distinguished for intelligence and self-assertion, for devotion to human rights and progress, and for a lordly determination to preserve their own prerogatives. With this estimate of American agriculture I have written this book."

Keeping the ideas above conveyed steadily in view he has given us in this work the most delightful commingling of romance, science, practice and theory to be met in much reading. It is the fashion of late to make scientific and practical books like sugar-coated medicine, very palatable to those who must take them, and this effort of LORING'S is one of the most delicious of its kind. The practical is hard and to the point, but so skillfully surrounded by the imagination that one has swallowed the dose and likes it, too, before fully realizing its force and effect. Frequent occasion has been made in these columns to deprecate the sugar-coating process as applied to scientific and practical books, which are, or should be, prepared for those who are sufficiently interested in the subjects treated of to be above the need of any such appetizer. In this instance, however, the author has so far overstepped the usual limits of attractiveness by his pleasing style, his easy transition from one subject to another and his profuse illustrations, that even those who are but slightly interested in practical or scientific matters are irresistibly led to a perusal of the whole work. Before closing, it seems almost imperative upon us to make a quotation from the speech of President HOPKINS at the opening of the Club:

"The first question is not, 'Does farming pay?' for every man knows that it does pay everywhere. It pays in Massachusetts and in New York and in Ohio and in Texas, in Germany, in Egypt, in Japan, in California. It pays throughout the world. And so I think the question should be put thus:—'Does farming pay whether you attend to it or not, and whether you understand it or not?'—a question so easily answered that it is unnecessary to waste time on it here. But behind all this lies the fundamental inquiry for us: 'Where shall I select my farm, and how shall I manage it?' And to this, it seems to me, there is but one answer. It is perfectly evident that the agriculture which is profitable in this section and is becoming more and more profitable throughout our country, is the cultivation of small farms for specific purposes, and with great care and skill, in the immediate neighborhood of a local market."

THE latter part of a man's life is taken up in curing the follies, prejudices and false opinions he had contracted in the former.

A RUSH of thoughts is the only conceivable prosperity than can come to us.—*Emerson.*

Sabbath Reading.

A VOICE IN THE NIGHT.

Oh! sweet and beautiful is Night, when the silver moon is high,
And countless stars, like clustering gems, hang sparkling in the sky,
While the balmy breath of the Summer breeze comes whispering down the glen,
And one fond voice alone is heard, Oh, Night is lovely then!

But when that voice, in feeble moans of sickness and of pain,
But mocks the anxious ear that strives to catch its sounds in vain;
When silently we watch the bed, by taper's flickering light,
When all we love is fading fast, how terrible is Night!

[*Rev. R. H. Barham.*

INQUIRING AFTER SALVATION.

As I read my Bible and attended the prayer meetings, I heard Mr. Gale preach, and conversed with him, with the elders of the church, and with others from time to time, and became restless. A little consideration convinced me that I was by no means in a state of mind to go to heaven if I should die. It seemed to me that there was something in religion that was of infinite importance; and it was soon settled with me that if the soul was immortal I needed a great change in my inward state to be prepared for happiness in heaven. * * * * After struggling for some two or three years, my mind became quite settled that the Bible was the true word of God.

This being settled, I was brought face to face with the question whether I would accept Christ as presented in the Gospel, or pursue a worldly course of life. At this period my mind, as I have since known, was so impressed by the Holy Spirit that I could not long leave this question unsettled, nor could I long hesitate between the two courses of life presented to me.—*Memoirs of C. G. Finney.*

THOUGHTS FOR THINKERS.

To think kindly of each other is good—but to act kindly toward one another is best of all.

DEFERENCE is the most complicate, the most indirect; and the most elegant and effective of compliments.

IF we are obliged to pay to enter into life, how many of us would demand the return of our money on departing?

To sneer and denounce is a very easy way of assuming a great deal of wisdom, and concealing a great deal of ignorance.

DON'T look too hard, except for something agreeable. We can find all the disagreeable things in the world between our own hats and boots.—*Hood.*

THERE are souls who do not need to live out, coarsely, in detail. Their inward conception transcends the visible form. Count it an assurance of more vital good when God denies you.—*Mrs. Whitney.*

EVERYTHING connected with our personality fails. Nature never spares the individual. We are always balked of complete success. No prosperity is promised to that. We have indemnity only in the success of that to which we belong.—*Emerson.*

MANY a life that might have been most efficient if rightly directed, has been lost to the world and doomed to mortifying failure, because men have not been sufficiently developed to know their own peculiar endowments or to make intelligent choice of a vocation.

BE frugal, not mean; prudent, not subtle; complaisant, not servile; active in business, but not its slave. There are also four other habits which are essentially necessary to the happy management of temporal concerns; these are punctuality, accuracy, steadiness and dispatch.

WHERE IS HEAVEN? Plato points to the snowy summits of cold Olympus and says it is there. Swedenborg beholds spiritual presence in all space and says it is everywhere. Wordsworth lives again through his youth and replies, "Heaven lies about us in our infancy." Sage, Theologian and Poet, I turn from you all and ask the little blind girl. She replies, "Heaven is where God is."

WHEN feelings of wonder at the magnitude of the universe and the harmony perceptible in all its parts fill the mind at such a moment, let us remember that He who made all these glorious objects and still keep them in their courses, nevertheless came down from heaven, took upon Him the form of a servant, and ended a life of sorrow by a death of pain, that he might reconcile a fallen world to an offended God.

THE United States' branch of the Evangelical Alliance has issued a declaration in respect to the restraints placed upon Protestant worship by the Government of Spain, which has been placed in the hands of the Hon. Caleb Cushing, U. S. Minister to that kingdom. The declaration sets forth "that in Protestant countries, like Great Britain and Germany, where the Protestant religion is established by law, and in the United States, where the population is Protestant by a vast majority, the people who adhere to the Roman Catholic Church are protected, equally with all others, in perfect freedom of worship; and it is an obvious principle that the same right should be conceded to Protestants in Roman Catholic countries."

Ladies' Portfolio.

THE REASON.

BY KATE MERIDEN.

Girls used to learn baking and brewing,
To read and to write and to count,
Now though they are always a-doing,
Their ways are of little amount.
Some chatter French verbs like a magpie,
While others embroider in floss.
And in this wise age which we live in,
Things useful we now translate gross.

Our grandmas, poor souls! were old-fashioned,
Their knowledge of matters was small,
And it showed their want of refinement
To darn stockings over a ball.
Now we are so much more enlightened,
Have made such a wondrous advance,
That though some cannot boil a potato,
They know how to flirt and to dance.

It is true that poor pa takes it sadly,
And talks of the poor-house for all,
While ma would give each one most gladly
To some verdant sir, if he'd call.
But men they have grown strangely cautious,
They do not prefer such a wife,
And this, my dear friend, is *the reason*
Some choose to live single their life.

THE COMING HOLIDAYS.

BY ROSE GERANIUM.

The question of suitable gifts is one which puzzles small heads as provokingly as older ones—at least it did a few years ago, and an eight-year-old maiden who brought me her bundle of confidential cares this morning, assures me that times are not changed.

Can *I* help you to a decision, my dear? Let me try. We will commence with an air-castle. Material—plain white writing paper, silver paper, hoop-wire, mucilage, fine white thread. Divide the paper into pieces two inches square, fold one over evenly, once, which will give you a tiny sheet two inches long and half as wide; press the fold firmly; then, commencing at the back, cut it into narrow strips, leaving them connected by one quarter of an inch on each margin. Open it with a broad knife-blade and wind first one end and then the other about a smooth, round stick, and glue them with a band of silver paper one quarter of an inch wide. The wooden mold should be small enough to let the white paper slightly overlap. Forty-four of these "castles" will be required. When finished, by means of a delicate needle secure a fine thread straight across the center of one end, looping it to the little cross-thread of the next, so as to keep them about one third of an inch apart. Make a circle of the hoop six inches in diameter and wind it with silver paper; then tie the rows on at even distances, leaving each alternate row so that its widest parts will be even with the narrowest parts of the others. Suspend the hoop by three threads. I think you will agree with me that this is one of the prettiest air-castles you have ever seen.

For a card-case, cut out two pieces of perforated card three inches long by two wide (larger if you like), counting the rows to have them exactly even. If you can cut them out in fret-work, to imitate a lace pattern, cross or heart, so much the better; but if not, work a neat border and center-piece with worsted, silk or hair. Line them with bright silk or ribbon and fasten them with little cross-pieces the same shade. Four pieces of ribbon half an inch wide will be required and as long as across the card-case, allowing for seams. Secure the ends under the lining, fastening the opposite ends of the straps sewed to one cover to corresponding places on the other. Lovely book-marks can be made by lining perforated card, cut in fret-work, with bright bits of ribbon or silver paper, and a beautiful photograph-case and book-marker combined, by having two pieces of card and cutting an oval from one for the picture. Ribbon should be placed between them and one end left open to admit the photograph.

For a pen-wiper, procure bits of dark cloth, scarlet flannel and a few round, black beads. Cut the darkest cloth in a circle three inches across and pink it. Make a flannel one one-half inch smaller. Fold into a half circle and then fold three times over, securing the edges with a stitch. Make the flannel one in the same way and draw it into the center of the dark one, fastening it with a bead. When you have done six, arrange five in a circle and catch the points securely with a thread. The sixth one will drop in and fill up the top, making a neat little pyramid and a really useful article.

A lovely picture-frame can be made in a jiffy, thus:—From a thin board, suitably cut with a ledge at the back, cut an oval frame two inches wide, with an opening to suit your picture. Wrap the frame with white candle-wick or strips of twisted cotton and crystalize, using the proportion of one pound of alum to a quart of water. The color may be varied by adding a little dye to the solution.

Some boy may delight his mother or sister with a slipper-box. It should be lined with stiff paper, made with a lid and strong leather hinges and covered with carpet or cloth. It might be a joint affair, and sister might embroider the cover. When done, it will look just like the most innocent footstool imaginable.

Please do not forget that four-year-old's dollie would be delighted with a pair of stockings—real, ones—white, with a red ring around top and toe. If you can knit, it will take but a little time to do them. And four-year-old herself might be made to dance at sight of so cunning a little "Malaga Turtle," as a pair of sweet hands fashioned for a wee girl, once upon a time. The materials required were a bit of card, six cloves and a big raisin! The raisin was flattened out properly, the round heads were nipped out of four cloves and they were arranged to just peep out for feet. One plump clove head looked forth where a head ought to be, and the stem of the sixth improvised a short but excellent tail. A few wise stitches secured it to the card. If possible, this excruciatingly perfect turtle outdid nature herself. I almost looked to see it wriggle!

There! Not another word, or the sage editor will reduce this article to ashes. But in all your gifts and happiness, do not fail to remember the poor and, if possible, add *something* toward cheering their cruel lot.

May the dear, loving Saviour, bestow upon you each, to brighten the New Year, the gifts of his peace, "which passeth understanding," and may your year be full of happy surprises!

WHIFFS FROM CANADA.

Holiday Employment.

Three boys come in with rosy cheeks and bright eyes, blowing their fingers as they take off mittens and caps. "I *tell* you it's cold," says Jamie, "and I don't think you'll get any more green, mother, for it's snowing now." They have been to the woods to gather the varied Lycopodiums used for Christmas decorations, and every spare hour the girls and I are busy making wreaths, sprays, crosses and other devices for the city market. For years the dealers in Montreal sent to Boston for their supply of these evergreens, until we offered some of native growth, which prove equal to the imported article, and although keeping our fingers busy in a busy season, supply the girls with pocket money with which to purchase Christmas gifts, and subscribe for the Rural and several magazines. The half-days they could spare from home lessons and Saturdays, for several weeks past, have been spent in the woods where Lycopodiums grow in abundance, bringing home a total of several cart-loads, besides bags of choice sorts, pigeon-berry and other low evergreens, with some of the ferns that give variety to the wreaths.

Another source of income to the children is the culture of everlasting flowers and ornamental grasses, which we grow annually from seed, picking every second or third day, and hanging in small bunches, *stalk* upward, in a dark closet to dry. But the superior and highly-colored flowers from Germany keep ours low in the market, and we find these low-growing evergreens, that need no cultivation, pay us better for the labor of arranging.

It is true that our fingers sometimes ache if we sit steadily at the work, but when we get tired there are plenty of other duties requiring our attention, and we return to our pretty trimmings with renewed energy. No one but the children seeks any of the profits of this Christmas weaving, and it is particularly the pin money for the little girls, who have not so many opportunities as their brothers for earning extra dollars.

If the time ever comes when we can send our products to New York and other cities in the States, without the duties that now prevent, I expect the rich woods around us will yield a wealth of ferns and autumn leaves, as well as Christmas evergreens, that will find readier sale than can be made with only our local market to supply. For richness of coloring and variety there is nothing that can surpass the beauty of our Canadian woods in late autumn, and I often wonder that travelers in search of varied scenery do not more frequently visit us in the pleasant, glowing October days.

If my hints are useful in any home where farmers' boys and girls long for a little spare cash to purchase what the hard-working father cannot afford, I shall be amply repaid, and I say to them, "Go to the woods, for *there* is rich material, not only for the articles I have mentioned, but for choice rustic work—from gnarled sticks and many other industries suitable for your hands, that a little thought will suggest—so that you, as well as our happy selves, may enjoy, in preparation and pleasant toil, a foretaste of Christmas."

Annie L. Jack.

EVERGREEN DECORATIONS—HOW THE CITY IS SUPPLIED.

With the near approach of Christmas, the sidewalks and stalls around Washington Market are filled with Christmas trees and decorations. A visit was made to several of these stalls, and in conversation with one of the owners our reporter was told that the season has not yet fairly set in, it being a short one, not lasting more than two weeks. Christmas week is their busiest time. The greater part of these trees are now brought from Maine, Connecticut, Pennsylvania and New Jersey. Many women in country towns find employment in the making of wreaths, crosses, stars, triangles and roping, which is used in decorating. The prices are much the same as last year, though the dealers complain that the demand is not so large as in previous years, which they attribute to the hard times. A five-foot tree can be bought for 25 cents; 15 and 16-foot trees, $6 to $8; a fine 23-foot tree, $15 or $20. The crosses, wreaths, stars and triangles are selling at $1 a dozen, and roping at 2½ and 3 cents a yard. The standing pine, laurel and cedar wreaths, which are very pretty, are also selling at $1 a dozen. The steamer which arrives every morning from Matawan, Keyport and other places, carries large quantities of these greens.

Reading for the Young.

STOCKING SONG.

ON CHRISTMAS EVE.

Welcome, Christmas, heel and toe!
Here we wait thee in a row,
Come, good Santa Claus, we beg—
Fill us tightly, foot and leg.

Fill us quickly ere you go,
Fill us till we overflow.
That's the way; and leave us more
Heaped in piles upon the floor.

Little feet that ran all day
Twitch in dreams of merry play;
Little feet that jumped at will
Lie all pink, and warm and still.

See us! how we lightly swing;
Hear us! how we try to sing.
Welcome, Christmas, heel and toe!
Come and fill us ere you go!

Here we hang till some one nimbly
Jumps with treasure down the chimney.
Bless us! how he'll tickle us,
Funny old St. Nicholas!

LETTERS FROM BOYS AND GIRLS.

From our Colonial Friend.

Dear Cousins:—Well, boys, I see the girls have aroused you at last. I was beginning to be afraid you were going to let them have the whip hand over you, but I was well pleased to see you were not going to endure their conceit any longer. Come, boys, I am going to enlist against them. I think they ought to learn how to speak to their betters. I like Young Editor's letters very much, and if we had a few more storms like the last one, we would soon have the girls overpowered. I agree with Y. E. about piecing quilts. What is the use of tearing up good cloth for the purpose of sewing it together again? I suppose they think it will keep them out of mischief. If it does, I think Belle E. F. ought to piece half a dozen quilts to keep her temper down. Do write, write again, Belle, and let us have another of your precious epistles. Well, Cousins, I shall fatigue you in going on in this way, so I will give you a brief description of the crops in this vicinity—indeed they might not be called crops at all. Wheat never yielded so poorly as it did this year, and all other grains are the same way. A large part of the grain being grass seed, I think the fowls will fare well this winter. We have cold weather here now, and have not had sleighing until two or three days ago.—R. H. C., *Ont., Can.*

A Duet.

Dear Rural Friends:—We have been reading the letters from the girls and boys, and thought we would write one, too. Young Editor thinks there is no use in cutting up calico just for the fun of sewing it together again. If he ever marries and his wife thinks as he does about it, we pity them both! We think Cousin Gypsy Belle is about right in regard to piecing quilts. We like Young Artist's letter and would like to correspond with her, if agreeable. We have our ideas about Young Bach, Storm, and Young Tom, but we will not express them, as there has been enough said on the subject, yet we would like to hear from them once more.

Now, we will tell you something about ourselves, provided you would like to hear. We are farmers' daughters, and are not ashamed to own it. We go to the same school and pursue the same studies. We are not sisters. One of us has an organ and the other a piano, and we can play on either. We can milk a cow or drive a horse, just as occasion may require. We are of the same age and hight, and weigh 185 lbs. each. We will now close. Hoping to see this in print, we remain,

Farmers' Daughters.

Monroe Still Alive.

Dear Cousins:—I have read the letters of the Cousins for some time, and I enjoy them very much, but I have never written until now. As all are welcome, I make no apology for intruding into the "magic circle." I think D. B. talks pretty "big" for a Cousin, but I like her plan of asking and answering questions, and would suggest that all questions should be designed to be of use to us, else they will be but a mere pastime. I would like to propose the following: What was the name and date of the printing of the first work ever printed? I should suppose the hottest town in America to be Macapa, being on the equator, at the mouth of the Amazon. Quito (Equador) is also on the equator, but high on the mountain, and hence cooler than Macapa. Isn't Alice too hard on Young Editor, for calling his paper a "sprightly sheet?" Not having a copy to judge from, I am sure I should like to see one. I have done considerable in the line of printing, but never started a newspaper.—W. B. J.

From a Western New York Girl.

Dear Rural:—I thought it would not be intruding, if I wrote a few lines for your valuable paper, as I am one of your many readers. I am a farmer's daughter, and live on a farm. I can do housework, cut and make almost any garment, sew with the sewing machine and piece bed quilts. I have made one called the "beggar's quilt," which contains 650 pieces, no two alike. I collected, pieced and completed it in six weeks. I can mow with the mowing machine, drive a wheel rake, drag, and harness a horse. Now I wish to ask Uncle True if he considers it improper for girls to know how farm work should be done? I have one sister and no brothers. I am fifteen years of age, and five feet eight inches in hight. My sister is four years younger.—May, *Albion, N. Y.*

[Regarding farm work, Uncle True thinks it highly proper that the girls should know how to do, and do as much of it as is consistent with health and modesty.]

A Wish that Should be Gratified.

Dear Rural:—I am not going to tell you about my complexion, except that I have got one. I live on a farm, as most of the girls that write to you do. I like to draw, and expect to take lessons next summer if nothing happens to prevent, and I hope some time to become an artist. I have a piano, and I have taken a few lessons, but I don't like to practice, and it is evident that I shan't be a very great musician. I got a great many autumn leaves last fall. I press them in books, and when they get perfectly dry I take them out of the books and varnish them with common varnish. I wish that some of the girls would tell me of something to make for holiday presents.—Nellie E. W., *Fairhaven, Vt.*

Canada is Heard From.

I long have thought I would like to be among the Cousins, so I have made a start. I am eleven years old. I go to school, and like it very much. I read in the Third Reader and learn Geography, Arithmetic and Grammar. I have five brothers and two sisters. My father takes the Rural. Mother is trying to get another person to subscribe with her; she would so like to get the plants the Editor so kindly offered. We have a very pretty garden. We took the first prize at the County Show this year on garden vegetables. This is my first attempt.—Amanda M. B., *Watkerton, Ont.*

An Editor's Chick.

Dear Sir:—I thought I would write you a few lines. I am a girl fourteen years old. I go to day school and Sunday school. I have a very nice teacher. My papa is the editor and publisher of the Times. My mamma has a greenhouse; it is looking very well. If you do not think our three letters too bad, we should like to see them in print. We want to surprise our parents and friends. We have not seen any from this place, and thought we would try. Please print this. I remain, your friend—Mamie C. Merritt.

From Lottie King.

Dear Mr. Editor:—I was so pleased to see my letter printed that I thought I would write again. I am very much interested in the letters to the Rural; I read them the first thing. Though I am very small, I am piecing a bed quilt too, like May Belle E. I study every day, and like it very much. I am glad to see the letter from Mary A. S. Your little friend—Lottie King.

From C. L.

Dear Mr. Editor:—I thought that I would write you a few lines. I am a little girl eleven years old. I go to Sunday school and church. I think a good deal of my Sunday school. Good-by.—C. L.

The Puzzler.

ILLUSTRATED REBUS.

☞ Answer in two weeks.

MISCELLANEOUS ENIGMA.

I am composed of 32 letters:
My 15, 5, 23, 27 a part of the human frame.
My 16, 8, 2, 5, 3 a range of mountains in Europe.
My 25, 19, 31, 24, 13 essential to vitality.
My 17, 15, 28 a pronoun.
My 21, 7, 12, 32 often causes great destruction.
My 1, 6, 27, 11, 29, 20 an article of common use in every household.
My 9, 5, 22, 4, 30 used by hunters in South America.
My 18, 26, 10 used by some musicians.
My 14, 10, 20 a number.
My whole is an ancient proverb.

☞ Answer in two weeks. S.

DECAPITATIONS.

1. Behead a part of the human system, and leave a conjunction.
2. An animal, and leave a pleasant beverage.
3. A flying animal, and leave a preposition.
4. What we often see by the roadside, and leave a loathsome disease.
5. Part of an apple, and leave a mineral substance.

☞ Answer in two weeks. P.

PUZZLER ANSWERS.—Dec. 16.

Illustrated Rebus.—Preaching in a silent discourse is a portion of our daily experience.

Miscellaneous Enigma.—"O Liberty, how many crimes are committed in thy name?"

Geographical Enigma.—Thou shalt not steal.

PUBLISHER'S NOTICES.

TO THE LADY READERS OF THE RURAL.

SPECIAL OFFER OF RARE PLANTS AND SEEDS

HAVING a few choice plants now growing in the RURAL'S EXPERIMENTAL GROUNDS, which we think would be desirable to some of the lady readers of the RURAL NEW-YORKER, we make the following offer:

Those who, in renewing their own subscription, send us an additional name (not already on our list) with the sum of $4.90 for the two, may select any two of the following-named plants and a paper of the seed of the Molucca Balm. Those who receive these premiums can divide with their friends, or keep them all, as they may agree among themselves, as our object in making the offer is to induce old subscribers to send us new ones, thereby increasing our list. The plants and seeds offered are very choice, as will be seen in description given below. The plants will be sent by mail free, and carefully packed and forwarded immediately on receipt of subscriptions.

Abutilon Boule de Neige.—The best of the *Abutilons*. Its flowers are large and white. It blooms throughout the whole year and therefore is alike desirable for the conservatory and garden.

Marie Lemoine.—Among a hundred or more varieties of double-flowered *Pelargoniums*, new and old, this is yet unrivaled. The individual flower, of a delicate rose color, as well as the truss, are the largest of their class.

Hydrangea paniculata Grandiflora.—So much has been said of this new Japanese shrub during the past year that little need be added now. It begins blooming in early August, continuing until after hard frosts. Hardy.

Variegated Ampelopsis or *Vitis heterophylla variegata.*—We do not hesitate to pronounce this one of the most attractive vines in cultivation. The leaves are deeply-lobed and variegated with white and green. Hardy.

Jerusalem Artichoke.—Believing that the Jerusalem Artichokes are exceedingly valuable as food for all kinds of farm stock, we place them among our valuable premium plants. They will yield more bushels of tubers per acre than the common potato and we believe them more valuable for feeding purposes; besides the Artichoke will grow vigorously where the potato would fail entirely. We will send one-half pound each of the Long Purple and Round White, for each new subscriber as above, or one pound of the tubers of either variety. We shall store a quantity of the tubers in the cellar for sending out this winter; but those of our subscribers who reside north of the latitude of New York City had better leave their plant premiums in our hands after the first of January until early spring. We will, however, "book" all orders received during the winter, to be sent at the earliest possible moment.

Achania malvaviscus or Malvaviscus arboreus.—The flowers are bright red, of a turban shape, two inches long. It blooms incessantly whether indoors or out. In the conservatory it may be trained so as to cover wood-work as readily as a vine. Its growth is so rapid that small plants set out in the spring will cover a space four feet in diameter by fall. As a plant for the sitting-room, the little care it needs, its perpetual scarlet flowers, contrasting elegantly with its golden-green, plush-like leaves—its endurance of dry heat and dust render it most pleasing and satisfactory. We commend this plant with confidence.

Moluccella laevis.—We will send, also, to ALL who are entitled to a choice of any two of the above plants, a package of the seeds of the beautiful Shell Flower, an account of which and an engraving were given in the RURAL of Aug. 17, p. 117.

TERMS FOR 1877, IN ADVANCE,

INCLUDING POSTAGE, WHICH PUBLISHERS PREPAY.

Single Copy, $2.50 per Year. To Clubs:—Five Copies, and one copy free to Agent or getter up of Club, for $11.25; Seven Copies, and one free, for $16.05, Ten Copies, and one free, $20—only $2 per copy. The above rates *include postage* (under the new law) to any part of the United States, and the American postage on all copies mailed to Canada. On papers mailed to Europe, by steamer, the postage will be 85 cents extra for each subscription. Drafts, Post-Office Money Orders and Registered Letters may be mailed at our risk. ☞ Liberal Premiums to all Club Agents who do not take free copies. Specimen Numbers, Show-Bills, &c., sent free.

News of the Week.

HOME NEWS PARAGRAPHS.

RAILWAY returns at the West, for part of November, show a general decrease in earnings compared with last year. On the St. Paul, Michigan Central, and Ohio and Mississippi, the loss is quite large. The Central Pacific gained handsomely in October, and the Louisville and Nashville also. Twenty-six roads report for October aggregate earnings of $10,765,891, against $10,886,540 last year. Of these roads, eighteen earned in October, $7,216,807, against $6,934,996 in 1875, and $6,968,117 in 1874. Four roads, the Union Pacific and Chicago, Burlington and Quincy included, report for September $2,732,662, against $2,523,544 last year. Forty-six roads earned in September $13,310,600, against $12,798,986 last year. Of these, twenty-three roads report for three years' earnings in September $9,842,351, against $9,245,768 in 1875, and $9,096,708 in 1874.

A dramatic scene recently occurred in the Supreme Court room in Salem, Mass., when Mr. Foster asked for the custody of his child, his wife having petitioned for a divorce. On cross-examination of the wife, she was brought to the point of confessing that she had no objection to living with her husband, when she fainted and fell down. There was great excitement in the court room, and when she recovered Judge Ames solemnly advised the parties to go home, to take no outside advice, to use a little common sense, and try to live together in peace. He then ordered them to appear again at court on a certain day for a further consideration of the case.

Chestnuts are as low as one dollar per bushel in Pennsylvania.

The British market is satisfied with American beef, and is now calling for American mutton.

Mr. Charles Cruer, of East Coventry, Pa., has two cows, from which he has made, during the past eight months, 515 pounds of butter.

The Gentile ladies at Salt Lake did their best to cast Delagate Cannon adrift on Salt River on election day. They went to the polls and argued with the wives of the saints. "Why, Mrs. Black, I'm astonished! How can you vote for Cannon? Has he not four wives, and can he love them all as he ought to? Take this ticket and vote for Baskin, who does not believe in the wholesale degradation of woman. Do not vote for a brute—a brute, a brutal brute." But Cannon was elected in spite of this splutter of opposition.

The health of Gov. Beveridge of Illinois is almost completely restored.

The first Winter meeting of the New York Association for the Protection of Game was held last week at the residence of Royal Phelps, who is President of the Association.

Both the Oxford and Cambridge University Rowing Clubs having declined the challenges sent them by Yale and Cornell, our boatmen will have no inducement to go abroad next year. It is creditable to their pluck that they were willing to meet the British crews on their chosen river.

Jack Frost was on a bender in Agricultural Hall. In the Portuguese wine department hundreds of bottles were broken, and in the American section, corks were popping in every direction.

A woman in Allegany County, N. Y., hasn't used soap in her kitchen for five years. She heats the water and then pours in a little milk. This softens the water, gives the dishes a fine glow, and doesn't spoil the hands.

Lumbering has been begun in the immense forests of Northern California. Some of the timber is of great size. It is believed the business will add immensely to the wealth of the State.

At a late meeting of the grain merchants a modification of the present tariff regulating the handling of grain was discussed. A committee was appointed to confer with the Committee on Grain of the Produce Exchange.

The Mikado of Japan has addressed a letter to the President of the U. S. congratulating this Government upon the success of the Centennial Exhibition.

The St. Lawrence and Ottawa Railroad Company has made a contract for the transportation of three million feet of lumber for the South American market. It will be shipped via Ogdensburg and Portland.

A collection of less than one hundred paintings belonging to John Taylor Johnston was recently sold at an aggregate price of $138,000. This is the most profitable sale of paintings which has taken place for a long time.

There seems to be a mania for inspecting theaters in large cities since the burning of the Brooklyn Theater. It will all die out however, until the next terrible accident revives it.

Four hundred employes of the Bureau of Engraving and Printing at Washington were discharged recently, nearly one-half the force. About two-thirds were women.

William J. Ree, the celebrated New York forger, was pardoned on the recommendation of State Prison Inspector Clark, Gen. A. C. Nevin of the Investigating Commission, and the agent and warden of Clinton Prison. They united in a statement to Governor Tilden that the evidence upon which he was convicted did not show guilt conclusively, and that it was almost certain that he was unaware of the nature of the forged note when he uttered it.

There can be little doubt that the taxation, State and National, on bank deposits and capital is too heavy a burden. Its effect within the past year or two has been to drive capital out of organized banks into private banking concerns. The result of such a change will be that, when business revives, the facilities for discount will be narrowed, and borrowers will have to pay higher rates of interest than heretofore. If our banks can succeed in bringing these facts fairly before Congress and the Legislature, there should be little difficulty in obtaining a partial relief from the present burden.

Counting by States, the Speakership of the House of Representatives has been held by Pennsylvania three times, by Connecticut once, by New Jersey three times, by Maryland once, by Massachusetts six times, by North Carolina three times—for three successive Congresses and by one man, Nathaniel Macon; by Kentucky eight times, Henry Clay being speaker; by New York twice, by Virginia seven times, by New Hampshire once, by Tennessee three times, James K. Polk being twice Speaker; by Indiana five times, Schuyler Colfax being Speaker three of those times; by South Carolina once and by Maine three times.

Greenwood Lake is being drawn down to remove stumps which interfere with navigation, and fish are left in holes and shallows, where they would die when the water recedes. These are gathered by the Society for the Protection of Game, in barrels, and removed to the deep water of the lake. In some days as many as twenty barrels have been removed, and among them some fish, weighing several pounds.

Young Mr. Lick has returned to Pennsylvania to procure the proper papers for a final settlement of the estate which is now pending, and he is visiting the relatives of the late James Lick with that view.

The heavy fall of snow has made good sleighing in the City of New York for the first time in several years.

Mr. George C. Gorham, Secretary of the Senate, was surprised on his wedding day by a joint gift from the Senators of the United States. This was a large silver bowl, lined with gold, raised on a high silver standard, and a waiter, both evidently intended for fruit and flowers, as a central ornament for a dinner or supper table.

M. C. Butler, who has just been elected Carolina Senator by the Hampton Legislature, is a nephew of Oliver Hazard Perry, the hero of Lake Erie, his mother, still living at an advanced age, being a sister of that officer. Of the Perrys seven have belonged to the navy of the United States, as follows:—Capt. Chris. R. Perry (1798); Capt. O. H. and M. C. Perry (of Lake Erie and Japan), their brothers, Raymond and Alexander Perry, midshipmen—the latter was lost off Callao by the swamping of a boat in 1821; Lieut. O. H. Perry who resigned his commission to take charge of cotton mills at Cabotville, Mass., and the late Lieut.-Com. M. C. Perry, jr.

The New Haven agent of the Montreal photographer, whose consignments of college photographs were recently seized by customs officers, says there was no intention to violate the revenue laws. The delivery of photographs and albums to the present Senior Class at Yale will not be delayed, for the consignments which were seized were not this year's work.

There is a tardy afterclap in Florida. The Supreme Court has issued a peremptory order for a new canvass from the face of the returns. The telegraph does not say whether this order affects anything but the State ticket.

The campaign, whose plan may be formulated in the words of Capt. Egan, Second Cavalry, "to wait until the thermometer drops to 30 degrees below zero and then hoop 'em up to the Little Missouri," may be said to have fairly commenced, as the command is now 18 miles from Fort Reno, the last evidence of civilization. At Fort Reno people will live in houses this winter and have some of the comforts of a home. This expedition consists of 11 troops of cavalry commanded by Col. Mackenzie, Fourth Cavalry, and 14 companies of foot troops commanded by Lieut.-Col. Dodge, and the Twenty-third Infantry. In addition to these there are some hundreds of Indian scouts, Pawnees, Sioux, Arrapahoes and Shoshones, who, with the teamsters and civilian employes, bring up the force to over 2,000 men.

Chickens are hatched by steam at the Vennelys' poultry farm, Pentwater, Mich. The hatching house has been built in the form of a cross, giving five rooms, each 12 feet square, in each story. The first floor is devoted to hatching, and the incubator stands in the room looking toward the east. It is not a very pretentious looking piece of mechanism, but it will hatch 300 or 400 chickens at a time. Spring chickens all the year round—'tis not a bad idea.

Dr. Lindermann, in the course of an interview which is fully reported in The San Francisco Chronicle of Dec. 13, attributed the rise of silver to the heavy purchases of coin which the United States Government has been making in London and on the Pacific slope, and to the enormous demand for silver in China.

FOREIGN NOTES.

THE change in the method of placing young men in the English army since the abolishment of the purchase system a few years ago is said to work excellently. The old titles of Ensign and Cornet have been abolished, and that of Sub-Lieutenant was substituted; but that, too, has been done away with, and the lowest commissioned grade in the English army is now that of Second Lieutenant. There is no longer competition for commissions, but the British youth, since the first of the present month, are called upon to compete for admission to the military university of Sandhurst, where they will remain one year, and then be commissioned according to their qualifications.

A Paris evening paper announces that one of the servants of Don Carlos has run off, carrying with him all his master's jewels.

Forty thousand men are now employed at shipbuilding on the Clyde, and one of the builders recently declared that the Clyde shipbuilders could reconstruct the entire British navy in two years.

Work at the Champ de Mars for the next International Exhibition is going forward very rapidly. More than a thousand laborers are at work on the foundations of the east and west pavilions and the terraces. Germany manifests even greater indifference than she did while preparations were making in Philadelphia. The Chambers of Commerce assume that manufacturers and exhibitors will not send enough goods to warrant the large expenditure that will be necessarily incurred, and the Government has decided not to take part officially in the Exhibition of 1878.

Emperor William closed the session of the German Parliament Dec. 22, with a speech from the throne. His Majesty said, in reference to foreign affairs, "The negotiations of the Powers upon the Eastern question, as far as proceeded with, justify the hope that my efforts and the mutually conciliatory and peaceful intentions of the Powers immediately concerned will be successful in solving the pending questions without prejudice to the good relations now existing. Germany will continue by friendly disinterested mediation to lend her co-operation for the attainment of this end."

The London Times' Berlin telegram says the plan for the temporary transfer of a certain number of foreign soldiers into the Turkish service is a failure. No second rate state will meddle with the Eastern question. Belgium had been confidentially sounded and had declined to take any part in Eastern affairs. Thereupon it appears the plan of introducing a foreign police into the Turkish service was mooted by England but it was rejected by Russia. If any plan involving the presence of a foreign force be submitted to Turkey, it can only be a revival of the first of the above mentioned schemes framed in general terms, and recommended without very strong hopes of its success.

The London Post announces in official form that Belgium has refused to supply soldiers for the occupation of Turkey. It is said that it is now proposed that each Commissioner be accompanied by a thousand of his own countrymen as a police force.

A Times' Pera telegram says the Sultan is ill, and his indisposition is of a nature to cause some uneasiness. He is preparing to go to the neighborhood of Adrianople and remain there a month.

The Daily Telegraph's special from Pera says Midhat has communicated to the Sultan the informal conclusions of the European Plenipotentiaries. At this interview it was resolved that Turkey could yield in nothing which would impeach her independence. Other special correspondents, however, think Turkey will accept the proposals of the Powers. The Standard's and Times' representatives at Pera express this opinion strongly.

A dispatch to the Russian Telegraphic Agency says the preliminary conference has terminated happily. The accord of the Powers is complete. The disposition of the Porte, however, does not look very favorable. Military preparations continue in Russia.

It is positively asserted that Belgium has been officially requested to send troops into Bulgaria. The Brussels press generally disapprove of such action.

Pungu, a young gorilla, lately received at the Berlin Aquarium, is the pet of the Prussian capital, and dwells in a large glass palace erected for his express occupation. His interesting manners have been the subject of a paper read before the German Association of Naturalists and Physicians.

Ismail Sadick Pascha, the late Egyptian Minister of Finance, who has been condemned to banishment for alleged disloyalty to the Khedive, was the son of a poor laborer. His mother was the nurse to Prince Hassan Pascha, and upon the accession of the latter, he was appointed Inspector-General. This and other official positions gave him great opportunities, and he soon acquired a thorough knowledge of the resources of the country and also of the private fortunes. When the Khedive's financial embarrassments began, Sadick Pasha presented his information. It was considered most precious, and he was naturally placed at the head of the Department of Finance for the purpose of working the mine of wealth he had discovered.

Burnett's Flavoring Extracts are used and endorsed by the best Hotels, Confectioners, Grocers and the first families in the country.—*Ex.*

FRANK MILLER'S LEATHER PRESERVATIVE and Water Proof Blacking received the highest and only award at the Centennial Exhibition.

THE RURAL NEW-YORKER wants good local agents. Address RURAL PUB. CO., 78 Duane St.

FRANK MILLER'S HARNESS OIL received the highest and only award at the Centennial Exhibiton.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Dec. 23, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls.	72,888	Molasses	4,188
Whisky	2,501	Rice, bbls	800
Corn meal, bbls.	1,157	Cut meats, pkgs	36,682
Corn meal, bags	770	Lard, pkgs	22,802
Wheat, bush	406,120	Tobacco, hhds	295
Corn, bush	159,321	do, pkgs	2,884
Oats, bush	118,110	Butter, kgs	22,498
Rye, bush	37,509	Cheese, bxs	15,110
Malt, bush	15,030	Cotton, bales	32,668
Barley, bush	37,800	Rosin	8,782
Beans, bush	5,528	Spts, turn., bbls	1,508
Grass seed, bush	8,415	Dried Fruits, pkgs	362
Beef, pkgs	836	Eggs, bbls	2,736
Wool, bales	1,051	Peanuts, bags	2,514
Hops, bales	2,217	Leather, sides	107,911
Pork, bbls	1,708	Sugar, hhds	633
Tallow	1,574	Oil cake	7,064

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be

sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible: mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival here of summer items on Saturday.

BEANS AND PEAS.—Exports of beans, past week, 718 bbls.; since Jan. 1st, 56,502; same time last year, 36,135. Exports of peas past week, 8,350 bush.; since Jan. 791,203 do.; same time last year, 488,150.

Exports of peas, 8,350 bush.; since Jan., 704,203 do.; same time last year, 488,150.

The supplies of beans continue moderate, and the limited but steady demand keeps prices running upward. We speak of the standard grades, mediums and marrows; fancy pea and kidneys are neglected at the prices. Canadian field peas are quiet and weak. Western do. are 5c. lower than Canadian. Green peas unchanged. B. E. peas strong. We quote:

Beans—New medium, $2.00@2.25; do. marrow, $2.45@2.50; do. pea, $2.05@2.75; white kidney, $2.60@2.65; red do., $2.80@2.85; Old Beans—Medium, prime, $2.10@2.25; marrow, $2.00@2.35; pea, prime, $2.30@2.50; white kidney, prime, $2.25@2.45; red do., prime, $2.15@2.60; black, $3.00@3.25; Lima, $3@4, the latter for State. Canadian peas, ₹ bbl., free, $1.10; do. bulk, 80@90c.; green do., new, $1.20@1.25; do., S. B. E. peas (2-bush. bags), $2.25.

BEESWAX.—There is very little doing, with prices without change; Western quoted at 31c., and Southern at 32c.

Exports past week, 681 lbs.; since Jan. 1st, 76,645 do.; same time last year, 102,151 do.

BUTTER.—There is little to remark about butter. Sellers do not seek business at this season and if they did they would not find many wholesale buyers. Fancy state half tubs and the moderate supply of do. creamery have an active sale for daily wants at full late prices. Full dairies are still quite largely represented in the stock which is not an encouraging feature at this late date. There is a large quantity of quality butter in market, chiefly temporarily condemned State firkins, that looks as though it would drag for a long time, unless a positive scarcity of fine grades promotes the quality further on. The export trade seems to have subsided, all good grades of Western are selling freely. The absence of shippers tames the tone of fair grade firkins and other under lots. Some of the Western creameries have taken a settled position for first class use. Fresh rolls are in demand; made-over rolls are not saleable. We quote.

Exports past week 111 pkgs.

We quote:—Creamery choice, 36@38c.; good, 33@35c.; State firkins, choice, 28@29c.; fair to good, 24@26c.; do. half firkin tubs, choice, 33@35c.; fair to prime, 28@32c.; do.; poor and off-flavored, 22@23c.; Welsh tubs, choice, 30@32c.; other, 24@28c.; Inferior State 15@19c. Western creamery, choice, 38c.; other, 32@34c.; do. firkins, best, 18@20c.; other, 15@17c.; dairy tubs, choice, 25@27c.; other, 18@23c.; factory choice, 22@24c.; other, 13@15c.

State dairies quotable at 30@32c. with full tubs Welsh tubs dairies, 28@29c.

State firkins dairies, 25@30c. Roll butter, fancy 33@24c., fair to good, 20@23c.; do., poor to fair, 15@19c.

CHEESE.—There has been a quiet market this week, but as this is expected about the holiday period, prices have not been disturbed, and in fact there is fully as much confidence. Receipts run small, and there is sufficient moving in connection with home trade purchases to at least prevent further accumulations. The low and medium grades have been in most request. Strictly fancy factories have sold at 14½@15c. for white and colored lots. We quote:

Fancy factory at 15c. for fancy colored, 14½c. for fancy white; job lots, 15½c.; good and prime, 13½@14½c.; fair, 11@12½c. State farm dairy, fancy, 13½@14c.; good to prime, 12½@13½c.; fair and good, 11@12½c.; common, 5@8c. Western factory, fancy, 14@14½c.; good and prime, 12½@13½c.; fair lots, 10@11c.; factory, State and skims, 3@4c.; do. late, 8@10c.

Exports past week, 11,388 boxes. Liverpool quotation, 68s.; London, 69s. Gold closed at 107⅜.

COTTON.—There has been very sharp changes, closing weak; export demand is small. The latest prices are:

December, 12 11-32@12¾c.; January, 12 7-16; February, 12 23-32@12¾c.; March, 13 15-16@12 31-32c.; April, 13 5-32c.; May, 13 5-16@13 11-32c.; June, 13 15-32@13¾c.; July, 13¾@13 21-32c.; August, 13 23-32@13¾c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	10¾	10¾	10¾	10¼
Strict ordinary	10¾	10¾	10¾	10¾

DRIED FRUITS.—In apples quarters have been slightly advanced on a fair export demand; sliced are very dull, and about nominal. Peaches are scarce and sell at extreme figures. Blackberries are hard to sell.

Exports past week 2,660 bbl. dried apples.; since Jan. 1st., 33,871 do.; same time last year, 11,011.

Apples—State, sliced, 5½@6c.; do., quarters, 5¼@6c.; Southern sliced, new, fair, 4½@5¼c.; choice do. 5¼@6c.; fancy, nominal; do., new qrs., in bags, 3¼@4c.; do. repacked, 4¼@5c.; Western quarters 5@5¼c. Blackberries at 8½@8¾c. Peeled peaches, at 22@24c.; fair fancy North Carolina; 19@20c. for prime; 18@19c. for prime Georgia; 15@16c. for good; unpeeled peaches, halves, 9@10c.; do. quarters, 8½@9c. Raspberries, 28@29c. Cherries, 17¼c.

EGGS.—Light receipts alone sustain the market. Western are, as the times are, rather high for general use, and pastry people are not purchasing heavily either in limed or fresh. The stored stock has been worked down some, and a continuance of cold weather may hold prices where they are, but strong advances will injure what moderate trade there is. We quote:

Jersey, single barrels, strictly fresh, 33@35; State and Penn., 30@31c.; Western, fresh laid, 29½c.; Western and Canadian, fair marks, 28@29; Southern, fresh laid, 28½@29½; State limed, 20@22c.; Western, do., 18@20c.

ESSENTIAL OILS.—The following are the current rates:

Peppermint, $2.50 ₹ lb. in tin, $3.25@3.50 in glass—tone firm. Sassafras scarce and firm at 50c. ₹ lb. Wintergreen, large supply, weak at $2.30. Spearmint, nominally $2.50 ₹ lb.; no demand.

FEATHERS.—Light. Live geese, white, prime western 55@58c., mixed western, 40@50c.

FLOUR.—This market has been steadily working upward. The chief stimulus to this was the advance in railroad rates from the West, but millers, also, have become more confident on the cost of wheat, and have sent orders to hold, in instances much above the advanced figures quoted. While the market was strengthening, the home trade has been more desirous to stock up, and considerable business is resulting from this direction. Exporters are buying more freely also.

The latest sales are $5.20@5.40 for poor to very choice superfine State; $5.00@5.70 for very common to fair extra do.; $5.75@5.80 for good extra do. $5.85@6.00 for fancy do., and $6.05@7.25 for fancy to very choice extra; $5.20@5.10 for superfine Michigan, Indiana, Iowa, &c.; $5.40@5.70 for shipping extra do., the inside price for inferior, and $5.75@5.85 for choice to very fancy extra do.; common to choice white wheat extras, $6.90@7.25; fancy do. $7.30@8.25; winter wheat, good to choice family, $6.30@8.50; round-hoop Ohio, $5.60@5.70, and trade brands of do. at $5.75@7.25; St. Louis, $5.65@6.75 for common to fair extra, and $6.80@8.25 for good to very choice; Minnesota "straight" at $6.75@7.50, and patent at $7.00@9.50; unsound stock at from $3,90@5.75; city mill extra for West Indies at $6.40@6.60; do. English brands, $5.55@ — ; do. trade and family, $7.00@8.50; No. 2 at $4.00@4.65; sour, $3.90@5.75.

Buckwheat is scarce and higher; sales at 90@95c., and buckwheat flour at from $3.75@4.10. Corn meal brings $2.80@3.10 for yellow Western, Penn. & Jersey, and 83c. for Brandywine.

FRESH FRUITS.—Exports past week, 2,225 bbls.; since Jan. 1st, 115,102 do.; same time last year, 43,312 do. The holiday wants give some activity to the general market; still, foreign fruits call for a share of the local demand, and prices for domestic apples, grapes, oranges and nuts do not improve. Fancy red apples occasionally exceed our top rate. Lady apples are in large supply; must be smooth and showy to bring $8. Prime cranberries active; no sale for poor lots. California pears are in large supply and moving as fast as holders would wish them to. Nuts of all kinds quoted easy.

Apples, State, ₹ bbl., prime red, $1.75@1.87; mixed, $1.25@1.62; good to fair, $1@1.25. Lady apples $5@8. Cranberries, crates, $2.50@3.00; Eastern, bbls., good to prime, $8.50@10.50; N. J., $8@9, for good to prime. Grapes—Catawba, ₹ lb., 10@12c. Peanuts—Va., fancy, $1.05@1.15; other, 10@90c. Hickory nuts, coarse, 50@60c.; shellbarks, $1@1.50; black walnuts, 50c.

FURS AND SKINS.—The receipts are moderate and the demand fair. Mink are very dull and rule in buyers' favor. Southern skins are rated about 20 per cent under western.

	No. 1 quality. Nor. & East.	West & N. W.
Otter, ₹ piece	$6 50@ 8 00	$4 00@ 6 00

Skunk, black		75@
striped		10@ 50
Wolf, mountain		2 00@ 3 00
prairie		75@ 1 00

GRAIN.—There has been a good deal of excitement in the wheat market, and prices stand fully eight cents per bushel higher than noted last week. This has been brought about largely by resumption of export demand, with liberal purchases generally; also stimulated by the higher rates of freight from the West. Latest sales are at $1.32 for No. 3 Chicago spring; $1.38@1.39 for No. 2 do.; $1.40@1.42½ for No. 2 Milwaukee spring; $.33 for No. 3 do.; $1.37@1.45 for winter red Western. Rye is strong at 80@83c. for Western; 91@95c. for Jersey, State and Pennsylvania. Barley is lower; No. 1 Canada quoted at $1.10; No. 3 do., 87½@90c. Corn is also better, and fairly active; sales at 56@58c. for mixed Western. Oats have been active; mixed Western and State at 38½@50c.; white do. at 45@52c.

HAY AND STRAW.—With small receipts and a liberal inquiry, prices are slightly better.

Bale hay 65c. for shipping; 70c.@$1 for retail qualities; clover, 55@65c.; salt, do., 50@60c. Straw quoted at 75@80c. for long rye; 65@75c. for short rye, and 55@60c. for oat.

Exports past week, 700 bales., since Jan. 1st, 41,250 do.; same time last year, 41,118 do.

HIGHWINES, quiet at $1.13.

HOPS.—There has been more done here and in the interior, shippers having rather freer orders, and more confidence exists as to prices.

New Yorks, good to choice, new	25 to 30
New Yorks, low to fair, new	15 to 25
Eastern, new	20 to 25
Wisconsin, new	12 to 22
Yearlings	10 to 15
Olds, all growths	4 to 8
California, new	28 to 30
Oregon	28 to 30

HONEY.—The quality of the remnant is against quick sales and prices are extreme. We quote white clover comb at 15@16c.; other, 10@14c.

LEATHER.—Hemlock sole at 24@27c. for light, 26@30c. for middle, 27@30c. for heavy, and 24@26c. for good damaged.

OIL CAKE.—Sales of Western at $37.

PROVISIONS.—There has been a sharp upward movement on a brisk speculative trading, but closing weak. Mess pork quoted at $17.15@17.25 on spot, $17.20 for February, and $17.35 for March. Dressed hogs, Western, at 7@7¾c. Bacon at 8¾c. for long clear and 9¾c. for short clear. Lard, Western steam, at $10.80 for spot and December, $10.75 for January, and $10.92½ for February. Stearine at 10¾c. for prime Western. Tallow at 8¼c. for prime. In bbls. Beef hams at $20 for choice Western. Beef at $10.50@11 for plain mess, $12@12.50 for extra mess, $20@21 for prime mess, and $22@21 for India mess. City extra India mess at $25.

POULTRY AND GAME.—In live poultry there has been a fair demand for turkeys; but fowls and chickens are quiet. Western geese have declined. Ducks steady. We quote:

New Jersey turkeys, 11@12c, ₹ lb.; Western, 9@11c.; N. J. fowls and chicks, 9@10c.; Western, 8c.; roosters, 5@6c. Geese, N. J., ₹ pair, $1@1.50; Western, $1.25@1.50. Ducks, N. J., ₹ pair, 75@$1; Western, 50@65c. Live pigeons, ₹ pair, 25c.

The dressed poultry trade has recovered from its late unfortunate condition. Stock has sold well nearly all the week. Prices are not high, still they are not losing for the producer. Geese do not seem to sell as freely as formerly for Christmas use. Sellers need to count upon a lively trade in them, especially to the foreign element of our population. Unfortunately, a large portion of that class, this year, cannot afford to keep up traditions. Perhaps we might say the abundance of game of late years, with popular prices, more widely distributes the family demand. When the holidays close, the call for heavy turkeys falls off. Del. & Md. geese sold as well as New Jersey. We quote:

Turkeys, N. J., 12@16c.; State, 11@15c.; Western, 9@12c. Chickens, dry-picked, 10@13c. N. J. chicks, 10@13c.; State, 8@11c.; Western, 8@11c. Ducks, N. J., 11@14c.; State, 10@14c.; Western, 8@12c. Geese, 6@9c. for common; 10@12½c. for good to best.

In game, grouse seem about the only item at all scarce. The demand is good. There is usually a spurt for holiday purposes. Rabbits are very abundant. Extra saddle of Minnesota venison are firm. Western wild ducks do not sell above inside prices.

We quote.—Canvas-back ducks $1.00@1.75; Red Head, 65@75c.; Mallard 50@70c.; Teal, 50@60c.; common, 25@30c.

Quail, ₹ doz., prime, $1.25@1.50; soft small, 60c.@$1. Partridge, 65@75c.; drawn, 40@50c. Prairie Hens, $1@$1.12; drawn, 40@80c. Hares, 30@40c.; Rabbits, 20@25c. Venison, whole, 9@10c.; long saddle, 11@13c.; short do., 14@15c.

SALT.—Ashton's quoted at $2.50; Deakin's, $1.30@135; Liverpool, ground, $1.05@1.10.

SEED.—Grass is very quiet; clover quoted at 15¾ for western, and 16½ for State. Timothy at $1.90@1.92½.

SUGAR.—(Refined). Quoted at 9¾@11c. for soft yellow, 11½@11¾ for soft white, 12¾ for crushed, 11¾@12 for powdered and granulated.

TOBACCO.—There has been a dull market through the week, and scarcely any improvement to be expected until after the holidays; prices are held as before.

VEGETABLES.—Exports of potatoes past week, 3,965 bbls.; of onions, 591 do. A large quantity of the exported potatoes have gone to Bermuda for seed. There is a lull in the potato trade, and high prices restrict business. Holders of fancy lots, however, demand the extreme of the week, $3.75. Cabbages have advanced. Onions show an important advance. During the week 100 boxes of fresh tomatoes arrived from Bermuda. Squash are higher.

Potatoes—Peach Blows ₹ bbl. $3.50@3.75. Early Rose, prime, $3.50@3.75; Peerless and Jackson white, $2.62@3 sweet, Del. $3.00@4; Va. $2.75@3. Cabbages, ₹ 100, $5@8. Marrow squash, ₹ bbl., $1.50. Hubbard Squash $1.75@2.00. New Russian turnips, ₹ bush., 75c.@—. Onions—Yellow, ₹ bbl., $2.75@3.00. white, $2.50@3.75; red, $2.75@3.00; Spanish, $2.

WOOL.—Transactions have been made dull, with few manufacturers in market, yet a stronger trade is anticipated with the turn of the year, and meanwhile there is a firm range of prices held on the various grades; *XX* Ohio fleeces have sold at 48c.; delaine at 48c.; *X* pulled at 38@40. Eastern Texas at 22@27c., and western do. 21@24.

ROCHESTER, Dec. 23.—Flour market strong: spring, $7.00; amber winter, $7.25; white winter, $7.50; double extra, $8.00. Rye flour quiet at $5.00. Wheat steady: Milwaukee club, $1.30@1.40; amber winter, $1.25@1.35; white winter, $1.25@1.38. Oats, nominal at 38@40c. Corn quiet at 58@62c. Corn meal, $1.25@1.30. Butter, 24@26c. Cheese, 12½@14c. Eggs, 23@25c. Lard, 12½@15c. Apples, bu., 30@40c. Potatoes, bu., $1@1.20. Beans, ₹ bu., 1.40@$2.00. Mess pork, $17.00. Wool, 25@30c. Hay, $10@12. Straw, $6@9. Timothy seed, $2.75@3.50; clover, $9.25@10. Mill feed firm at $16 for shorts, $18 for shipstuffs, and $22 for middlings. Railroad Freights—Flour to Boston, 35c. ₹ bbl.; to New York, 25c.; to Albany, 20c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Dec. 23, 1876.

THERE has been very little doing in the market this week. A few lots from farm dairies have been offered and sold at a range of from 10½c. to 12½c., according to quality. The farm dairy cheese coming forward is mostly "late ends," and much of it is inferior. There were several lots of factory cheese offered. One lot of 110 boxes brought 12½c. The Arnold Brothers sold at that price, and other factories, having a sprinkling of October cheese, obtained 13½c. Extra fine quality commands 14c. and upward.

The delivery of butter has been light. About 30 tubs winter-make went at from 24c. to 27c. Good grass butter is scarce, and 30c. is offered for it for home consumption.

We have advices from abroad to the last of November. Our London correspondent says cheese is very firm at the previous week's quotations.

American, extra fine, 72@72s.; fine, 63@70s.; good, 56@63s.; secondary and low grades, 36@50s. English cheddar brings from 82@91s.; Wiltshire double, 63@70s.; Cheshire medium, 48@51s.; fine, 70@82s.; Scotch, 68@76s. Dutch Cheese—Edams, 53@70s.; Gondas, 60@64s.; Derby shape, 62@64s.

Owing to the mild weather, butter, beyond going wants, is difficult to sell. The Friesland to hand is mild, and Normandy, owing to short weights, is not so popular, while all combined makes trade very unsatisfactory. We give quotations:

Clonmels, 114@116s.; Corks, 104@109s.; Dorsets, 174s.; Jersey, 120@126s.; Danish and Swedish, 120@170s.; Normandy extra, 120@166s. There is no American or Canadian in market. Oleomargarine, 90@104s. ₹ cwt.

LIVE STOCK MARKETS.

NEW YORK, Dec. 23, 1876.

RECEIPTS OF LIVE STOCK.

" last week	10,736	150	1,137	34,531	33,291

BEEVES.—Trade was fair on Monday last in good quality cattle, while poor quality herds had to be held on sale, except a very few sold at low rates; prices were 7¼@12½c. ₹ lb.; weights, 5½@11¾ cwt. Wednesday, trade slow, the herds to hand not being good enough in the aggregate to meet the demand; prices 7¼@11½c. ₹ lb.; weights, 5½@8¾ cwt. Thursday, sales fair at 6¾@12½c.; weights, 5@9 cwt. Friday, trade firm at 9@11½c.; weights, 6@10¼ cwt. From 51@58 lbs. net., has been allowed. Spanish herds sold at 6¾@7¾c. Native steers, 7½@11c.; grade, 10¼@11¾c. Oxen, 7@10½c., with one choice quality pair of Kentucky oxen at 12½c., live weight, 3,570 lbs. Dry cows, 7¾@8c. Heifers, 8@9c. Bulls, live weight, 2¾@4c. Mixed herds, 8@9¾c.

MILCH COWS.—Sales very slow and quality only fair, with a poor tail end. Seventeen cows sold at $38@59 ₹ head; 15 do. at $40@45; 22 do. $50@75. Several lots held on sale—calves included in all sales.

VEALS AND CALVES.—Trade very dull on a light run. Quality from poor to fair. Smooth quality veals sold at 8@8¼c. ₹ lb.; coarse quality calves at 4@6c.; also at $6@9.50 ₹ head. Country dressed veals and calves sold at 7@10c. ₹ lb.

SHEEP AND LAMBS.—Trade has improved and quality also. The flocks to hand have been from coarse to choice. Monday, sheep sold at 4@7¾c. ₹ lb.; lambs, 5¾@7¾c. ₹ lb. Wednesday, sheep, 4@6¾c.; lambs, 4¾@6¾c. Thursday, sheep, 4@6¾c.; lambs, 6@7c. Friday, the markets closed fair, sheep, 5@5¾c.; lambs, 6@7½c. Canada sheep, 5¾@7¼c.; State, 6@7¾c.; Ohio, 4¾@7¾c.; Michigan, 6@7¼c., including one choice quality high grade Cotswold, sold at 10c. ₹ lb.; live weight, 351 lbs. State lambs, 5¾@7c.; Canada, 6@7¾c. Mixed flocks, 5@6½c.

HOGS.—Trade in live hogs dull. Four car loads Ohio hogs, average weight 210@212 lbs. ₹ head, sold at 6¾c. ₹ lb.; one car load do., 231 lbs. do., $6.20 ₹ cwt.; one single deck do., 270 lbs. do., $6.18¾; two car load do., 200 lbs. do., 6¾c. ₹ lb. City dressed slow of sale at 7@7½c. ₹ lb.; general sales at 7@@7¾c.

HORSE MARKET.—City trade so small as to cause dealers to withhold quotations. An improved condition of business is looked for early in the new year. Twenty-seven horses arrived ₹ Erie Railway via Oak Cliff Station.

SUMMARY OF LIVE STOCK TRADE FOR 1876.

On an increase in numbers, trade in horned cattle cannot be said to have improved in values received nor in the quality of the herds to hand. On the contrary, farmers have placed their herds on the open markets for sale as beeves when they were utterly out of condition, being not even good as store cattle. Prices have fallen on all grades, and notably so on medium quality herds. One pleasing feature of the live stock trade has been the steady increase of the exportation of good quality dressed beef for the London and Glasgow markets. This foreign trade promises well for the future. In the year 1876, 475,772 head of horned cattle were sold at the Sixteenth St. and Harsimus Cove yards. This gives a weekly average of 9,130 head and 12 head over.

Trade in milch cows has been uniformly slow, with occasionally a fair demand for fair quality animals when such came to hand, which, however, was of rare occurrence. 8,175 cows have been received. Weekly average, 61 head and 3 head over. The run of veals and calves has been heavy the past year, and the quality has, in the aggregate, been coarse. The lots have been supplied from New York State dairy districts, and have been forced on the markets rather than offered for sale. 80,972 head have been received. Weekly average, 1,720 head.

Sheep and lambs have in general been fully in demand, and even when trade has been slow fair rates could be obtained. The quality of the flocks also shows an improved order of sheep farming. During the year, 1,254,316 head have been sold at the Sixteenth St., the Forty-eighth St., and Harsimus Cove yards. The weekly average has been 24,121 head and 14 head over.

Trade in hogs has been inactive. The demand in this city is only local, the foreign trade having almost left here. 1,326,033 head came to hand for the year 1876. Weekly average, 23,577 head and 28 head over.

The gross arrivals of all kinds of live stock as above described, for the year ending Dec. 31, 1876, has been 3,050,217 head. Weekly average of same, 58,613 head, against a total of 2,861,333 head of all kinds in 1875. Weekly average of same, 55,035 head.

RURAL PUBLISHING CO.,
78 Duane Street, New York City

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer.*

It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.

Amos Keug, Mallaman.—Earth worms are easily killed. If you will procure one and pour water upon it as hot as can be borne by the hand, the worm will be killed at once. It is only necessary, therefore, to place the pots up to the rim in water hot enough to kill them, though not hot enough to injure the roots to rid the earth of all the worms which it contains. Lime water is used also. Place a handful of lime in a gallon of water—stir it up and leave it to settle.

M. P. Prince, Ridgeway, N. C.—If not contrary to your rules, will you please tell who is the contributor to your columns signing himself "Working Farmer?" My reason for wishing to know is this: When I have read the writings of one person for any length of time, I find greater relish for them when I know who the writer is, and again, can make the proper allowance for our difference of locality when I know where he writes from. [Will "Working Farmer" please send his address as above?—EDS.]

Young Inquisitive, Albion, N. Y.—Will Frolic be so kind as to answer the following questions: When a couple are being married in traveling dress, should the groom carry his hat in his hand to the altar? Would it not be proper to keep on his overcoat? By answering the above you will confer a great favor and oblige a little, green, country lassie who is about to be married. ANS.—As the ceremony at a certain stage requires the use of both hands, the groom would find it both inconvenient and embarrassing to carry a hat. Either leave the head-gear in the carriage or relegate it to the care of the "best man." The overcoat should certainly be dispensed with, if for no other reason than because its use would infer a quasi-disrespect for one of the most solemn rites of the Church. The lady should also dispense with wraps.

C.—That carbonic acid is exhaled from the lungs may be proven by breathing in lime water which soon thereafter turns of a milky-white color. This is a test of the presence of this gas.

2. It is stated that air containing four per cent. of carbonic acid is injurious, or rather "unfit for respiration." Air once breathed is said to contain eight per cent. As persons are supposed to breathe seven cubic feet of air in a minute, the necessity of ventilating rooms according to the number of persons in them will be apparent. We read that "in the Black Hole of Calcutta, one hundred and forty-six Englishmen were shut up in a room eighteen feet square, with only two small windows on the same side to admit air. On opening the dungeon, ten hours after their imprisonment, only twenty-three were alive."

A close room 20x20x10 contains 4000 cubic feet of air. If a person breathes, say 10 cubic feet per minute, the air would all have been breathed in less than seven hours.

Forsythe.—Hydrogen, being the lightest of gases and, in fact, the lightest of known ponderable bodies, is that used for inflating balloons. It may be obtained as follows: Place zinc in sulphuric acid and water. The oxygen of the water forms oxide of zinc and the hydrogen is set free.

J. L. Z.—We have two Silver Maples, one of which has been cut back every year, the other has not been touched. The former is by far the prettier of the two trees. It is, in fact, so much more compact and shapely that at a distance the two would be counted different species. Silver Maples may be pruned now. Earlier would be better than later

Inquirer.—When the first leaves, or cotyledons, owing to a short caulile, remain in the ground, they are said to be *hypogeal* or *hypogeous*, as the acorn, bean, horsechestnut, &c. They exist not the less, and the first leaves *seen*, though the first true leaves, are not the cotyledons. It is these which support the plumule above and the radicle in the ground until the true leaves render their assistance unnecessary.

G. Marti, Houston, Texas.—Many thanks.

Mrs. J. P. Hawks, Goshen, N. Y.—Seeds, as requested, were sent to this address and returned.

J. T. R. wants to know if apples are having a good sale in New York City. Let him consult our market reports, and, in the future, read the RURAL a little more attentively, thereby saving his stationry and postage stamps.

P. K. S.—Yes; a law was passed by Congress, at the last session, making a very slim provision for investigating pestiferous insects; but the bill was so badly cut up that it will probably amount to nothing. Senator Ingalls introduced the original measure, and numberless other politicians assisted in the cutting process till the original bill was hardly recognizable.

Implements and Machinery.

Centennial Year of American Independence.

SWITZERLAND to AMERICA, Greeting:

We will call and see you next July and assist at your CENTENNIAL CELEBRATION. By the same opportunity bring you samples of the Celebrated Watches manufactured by our country-men, the MESSRS. BOREL & COURVOISIER of Neuchatel, for INSPECTION and EXHIBITION. These Watches are favorably known throughout the U. S., having been sold by our local agents in almost every City, Town and Village the past ten years. Their reputation for accurate performance is universally acknowledged. They are manufactured in Gold and Silver Cases, Stem and Key Winders. These Watches have superior quality of Nickel Movements, Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronized for R. R. use, fine Ruby Jeweled, set in Chaton, and warranted to perform with the regularity and accuracy of a chronometer. Ask your Watchmaker to see them before purchasing those of other makers, as we have been authorized to sell them at a reduction from former prices.

QUINCHE & KRUGLER,

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper* and in Premiums to Agents.

PERSONAL ITEMS.

MR. JEFFERSON DAVIS left his wife and daughter in Europe.

SAN JOSE, Cal., put up 100,000 cans of tomatoes last season.

LIEUTENANT-GENERAL SHERIDAN, is suffering from pneumonia.

BISHOP McLAREN has confirmed 1,000 persons during the past year.

MRS. ADMIRAL DAHLGREN entertains every fortnight one of the literary societies of Washington.

JANE GOLDSMITH, grand-niece of the clever Oliver, has just died at the Home for the Aged in Halifax, N. S.

BOTH Bret Harte and Mark Twain are prosecuting Canadian parties who have infringed the copyright of their books.

THE Hon. L. Letellier de St. Just, Minister of Agriculture, has been appointed Lieutenant Governor of the Province of Quebec.

A MASSACHUSETTS cow, when given the choice, prefers tobacco stems to hay as a steady diet. Her massa-chews-it, and she chews it, too.

SAYS Mr. Aldrich:—"A man of ordinary agility might walk over the greater part of Europe on the outstretched palms of the lower classes."

SIR EDWARD THORNTON, British Minister, always goes to receptions at a very early hour. He follows, and makes his family follow the laws of health.

THE clergymen of Chicago have invited Messrs. Whittle and Bliss, the evangelists, to carry on the religious meetings after Mr. Moody's departure for Boston.

THE Hon. A. H. Stephens has moved himself and his baggage into his committee room in the Capitol, where he is to live. He will not go home during the year.

DORE never goes to a cafe; lives with his mother; is industrious; plays the violin; was a friend of Rossini, and he rests from his painting to play on the piano.

A LONDON paper reports that Mr. Spurgeon "is far from well." He had so far recovered, however, during the latter part of November as to be able to preach on Sunday.

A WALNUT tree in the Crimea is at least 1,000 years old, and yields from 80,000 to 100,000 nuts a year. It belongs to five Tartar families, who share its produce equally.

EDWIN FORREST'S "Home" at Springbrook, is about to receive two elderly actors—veterans lagging on the stage—in the persons of Messrs. William Lomas and George G. Spear.

M. SHISHKIN, the Russian Minister at Washington, is of the medium height, has a close, well-knit figure, gray hair and ample mustache, pleasant, not handsome features, wears glasses and is the beau ideal of a German professor.

MRS. JULIA WARD HOWE preached at Newport on Thanksgiving Day. Mrs. Howe has a pretty, cozy country place a mile or two out of Newport, wherein, before her husband's death, she was wont often to entertain artists, good talkers, and literary people generally.

MRS. ROXANA NOTT, widow of the Rev. Samuel Nott, died in Hartford, Ct., recently, aged nearly ninety-two years. Mrs. Nott was the only survivor of the missionary band which was sent to India by the American Board of Commissioners for Foreign Missions in 1812.

MADAME RUDERSDORF, the singer, has a beautiful model farm at Lakeside, Mass. It is cultivated under her own eyes to a charm, and she owns quantities of the most valuable live stock. She makes remarkable butter, so good that it is sold in Boston for 90 cents a pound.

WALT WHITMAN does not believe in cremation. He said the other day that "it makes a fellow tremble to think of the iron-hearted progress of the age. When the life has gone out of the body I rather respect the old shell for all it has been as well as for all it has contained."

HUGH BANCROFT, the historian of the Pacific Slope, has a valuable library on his subject, having devoted his large income to it for a dozen years. Many of the official documents of the Mexican Government have been secured by him exclusively in periods of revolution.

THE Rev. James Henry Thornton of Baltimore, a negro, was arrested for stealing a coat. In his pocket, between the pages of a hymn book and a Bible, were pawn tickets representing a large amount of plunder. His pastoral calls had been the most profitable part of his parish work.

SOMEBODY said to Robert Hall:—"How many discourses do you think, Mr. Hall, may a minister get up each week?" Answered Hall:—"If he is a deep thinker and great condenser, he may get up one; if he is an ordinary man, two; but if he is an ass, Sir, he will produce half a dozen."

PRESIDENT GEORGE WASHINGTON once sent to his cousin, Mrs. Washington of Fairfield, a letter introducing a physician famed for the cure of cancer; and this letter has just been sent to Cincinnati to be sold by the descendants of the lady, who are living in Kentucky in straitened circumstances.

MISS SMILEY has been holding a series of services in the Congregational Church of Rutland, Vermont. She is about beginning another series in the Methodist Episcopal Church of Burlington. The Rutland Herald says:—"Miss Smiley has made a very favorable impression here as a preacher and as an accomplished and agreeable lady."

IT was Viscount Maidstone, son and heir of the Earl of Winchelsea and Nottingham, who lately enlisted as a common soldier because he was too poor to live otherwise, his annual income being a pittance of $2,500. He bought himself out of this engagement in a few days, but has now enlisted for the second time and for twelve years in the Royal Artillery.

QUEEN VICTORIA goes walking in a short dark serge petticoat: the heels of her boots are not half an inch high, the soles are broad and thick, and they are never blacked. She always welcomes news of the people, improvements in their manners, their health, and their appearance. She declares that visiting her humble subjects is better than going to the play.

MR. CHARLES DUDLEY WARNER says when he went buying ancient coins of the Greeks in Greece he "looked in the face of a handsome graybeard, who asked me 2,000 francs for a silver coin, which he said was a Solon. I looked at him to see if there was any guile in his eye; but there was not. I cannot but hope that this race, which has learned to look honest, will some time become so."

THE Hon. Lewis H. Redfield says that Mr. Weed is mistaken in thinking that only three of the veteran journalists of the State survive. Besides Mr. Weed, Mr. Follett, and Mr. Redfield, there is Mr. Chauncey Morse, who was editor and proprietor of The Ontario Repository at Canandaigua for 20 years. Mr. Morse, now 83 years old, lives in Detroit, and is bright and well. Mr. Redfield also is 83, and comparatively strong.

CAPTAIN BURNABY, the hero of the ride to Khiva, sometimes known by the soubriquet "The Strongest Man in the World," was recently appointed Commissioner to determine the boundaries between the Turkish and Selave armies during the truce, but it being represented in certain quarters that the appointment of Captain Burnaby for this purpose would give offence to the Czar, another officer is to be named.

THE Grand Duke Nicholas of Russia, whom the Czar has just appointed to the command of the Army of the Danube, is one of the Czar's three brothers. He is not regarded as a genius, military or otherwise. He has risen to his present military rank by seniority, and during the war, should one ensue, he will probably act entirely on the advice of his Chief-of-Staff, General Nepokoytzisky, who is one of the best soldiers of the Russian army.

MRS. ex-SENATOR HENDRICKS, in her very clever book on cookery, says that Senator Riddle of Delaware took much pleasure in his superior knowledge on the important subject of omelets. Once, when breakfasting with Mrs. Crittenden of Kentucky, an omelet of doubtful appearance was presented to him. "Before we proceed with our breakfast," said he, "let me teach you a valuable accomplishment." They repaired at once to the kitchen range, where the Senator immediately demonstrated his qualifications as a very fine cook.

GEN. GEORGE WASHINGTON was precise in dress and probably had many a pleasant little vanity of his own. In the Camp at Cumberland (1775) there was but one mirror, and that set in the end of a powder-horn used by his friend and comrade Col. Zachary Lewis. By this mirror Gen. George shaved his chin every morning and completed his toilet. The powder-horn is now in possession of one of Col. Lewis's descendants, resident in Richmond. The horn is still suspended upon the plaited leathern string by which it hung at the soldier's side.

EDUCATIONAL NOTES.

BOWDOIN has 241 students—three of them post-graduates.

THE Baltimore libraries have a total number of 250,655 volumes.

MISS "GAIL HAMILTON" was once a teacher in the Hartford High School; so was the Rev. T. K. Beecher.

LADIES have been elected to the School Committee of New Bedford from two of the wards of that city.

THE catalogue of Brown University for 1876-7 shows the number of the students to be 251, of whom 70 are Freshmen. There have been important changes made in the course of study, elevating the standard, and showing that the college is under the guidance of liberal and progressive educators.

PROF. SANBORN TENNEY of Williams has decided to lead a natural history expedition to the Rocky Mountains during the next summer vacation. His party is to be composed of 15 members, principally from the Lyceum of Natural History, and all will be required to prepare themselves for the expedition by careful preliminary work. Prof. Tenney hopes to work up some important scientific points, while the other objects of the trip will be to enrich the museum of the college and instruct those who accompany him. It will be known as "The Williams College Expedition."

MOST men know, in a sort of general way, that there is a Science and Geometry of Dress. Mrs. M. L. Jackson has done the world, and especially the feminine portion of it, a service by publishing a manual upon the subject, by the study of which ladies' and children's wearing apparel may be designed, drafted, and cut. She claims a new and original method of teaching, and diagramic delineations of garments in miniature accompany the volume. Finally, there is a Vocabulary of Fashion; and altogether, if the work is what it professes to be, which there is no reason to doubt, it will prove an acquisition to "the schools, dressmakers, and ladies generally."

New Publications.

Traveler's Guide.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTH-WESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which the y run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to

MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN

BETWEEN

NEW YORK AND CHICAGO

via Cleveland.

Leaves Erie Railway Depot, foot of Chambers St. New York.

7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars

The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

MOORE'S RURAL NEW-YORKER.—With its full corps of editors, and a new publisher of energy and ability, the management propose to celebrate the quarter-centennial of the pioneer RURAL in such a manner as to augment its popularity and usefulness. For a first-class, lively paper, containing matter of interest for all classes, take the RURAL NEW-YORKER, and do so at once, for the paper never was better, and its prospects never brighter.—*Freeport (Ill.) Journal.*

New Publications.

"It is more in accordance with the spirit and feelings of the reading public of America than any other magazine that is published."—*Daily Graphic, N. Y.*

"The 'Galaxy' is always more a magazine than any, and more varied in its range than any other."—*Independent, New York.*

J. E. POTTER & CO., Phila., Pa.

1850 Twenty-Eighth Year 1877

OF THE

RURAL NEW-YORKER.

THE GREAT ILLUSTRATED AGRICULTURAL AND FAMILY WEEKLY has

REDUCED ITS SUBSCRIPTION PRICE

For 1877.

It is the Standard Authority on AGRICULTURE, HORTICULTURE and DOMESTIC AFFAIRS, and is replete with news and improvements of value to

The Farmer,	The Dairyman,
The Horticulturist,	The Housewife,
The Stock Grower,	The Girls and Boys.

In addition to these Practical Subjects and its Market Reports, several pages are devoted to Household Recipes, pleasant Stories, Reading for the Young, Sabbath Reading, Fashions, News, and all topics of interest to the family. Thus it comprises

TWO PAPERS IN ONE

and cuts like a two-edged sword into the affections of the ladies and children, as well as the members of the family who seek instruction in their daily avocations.

A. S. FULLER, the celebrated Horticulturist, is Editor-in-Chief, assisted by E. S. CARMAN, the well-known Floriculturist and writer on Rural Topics, and X. A. WILLARD, the great practical Dairyman, who call to their aid as special contributors, S. B. PARSONS, Floriculturist and collector of rare exotics; WILLIAM ROBINSON, Editor London Garden; Col. F. G. SKINNER, Editor Turf, Field and Farm; Prof. CHAS. V. RILEY, Missouri State Entomologist; HERMAN STRECKER, Lepidopterist; WM. J. FOWLER, writer on Farm Economy; THOS. MEEHAN, Editor Gardeners' Monthly; JAMES VICK, the great Rochester Florist, GEO. SUCH, Floriculturist; JOSIAH HOOPES, noted Botanist; S. B. PECK, M. D., writer on Hygiene; HENRY HALES, the practical Poultry Breeder; L. A. ROBERTS, writer on Historical Subjects; and a host of other gentlemen equally celebrated and learned, as well as an efficient corps of Special Reporters, to keep the readers informed upon all subjects of interest to the Rural population.

From the pens of such celebrated writers the Practical and Scientific Departments receive life, while the Literary and Family Departments are under the careful supervision of a corps of experienced Editors and Contributors, who successfully devote their energies to making this Journal the superior of any in the land.

It contains each week sixteen pages of instructive and interesting reading, embellished with fine engravings upon all interesting subjects.

The Reduced Price is only $2.50 a year, postage prepaid by Publishers, and in clubs of ten or more only $2 a year.

The RURAL is so well known that little difficulty is experienced in forming a club in any locality, and every one is invited to form a club—thus securing their paper cheaper and benefiting their neighbors.

Every one can have a specimen copy FREE, and, if they desire to form a club, a list of Premiums to Club Agents, by addressing

RURAL PUBLISHING CO.,
78 Duane St., New York.

ACT AS AGENTS!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

Wit and Humor.

BOY WITH A LEGAL TURN OF MIND.

"Well, you are a nice boy to send on a message," said a woman to a boy who had lost a bundle with which she had intrusted him. The boy struck the attitude of an orator, and replied; "Not being a common carrier, and not having entered into a contract with you to carry your parcel for and in consideration of any sum, I have incurred no liability, and am liable to no penalty. If I had undertaken to carry the parcel for my own particular profit, my father even would not have been responsible for the loss (see Butler against Bassing, 2 C. & P. 614), unless indeed he paid me smaller wages because of the opportunity thus afforded me to take small sums. On this point I will only quote Dwight against Brewster, 1 Pickering (Miss.), 50. But, rising from the law to the equity of the case, I have only to say—" but before he could say it his father had yanked him from the room.

SPARKS AND SPLINTERS.

The most popular 'general—General Holiday.

Spilkens always insists on spelling needle, niedle. He says every needle should have an eye in it. Sew!

A man out West, who offered bail for a friend, was asked by the judge if he had any incumbrance on his farm. "Oh, yes," said he, "my wife."

Spriggins says that he once prevented a severe case of hydrophobia by simply getting on a high fence and waiting there till the dog had gone away.

"Mary!" said an uptown woman to a new servant, "when you hang out the clothes, be careful to always put the nicest pieces nearest the street."

A sermon in Barbadoes recently was closed thus: "My obstinaceous bredren, I find it no more use to preach to you dan it is for a grasshopper to wear knee-breeches."

A clergyman in Northern Indiana ascended the pulpit the other Sunday and said: "No man can serve the Lord while he has the jumping toothache. I therefore dismiss the congregation."

"My business is to talk,' said a stump-speaker. "I deal in words and sentences." "Yes," said a voice in the crowd, "and as long as I have known you your place of business has never been closed."

Miss Sally Northrop, a Connecticut lady, has sallied forth upon the "unknown sea" at the age of 100 years. She would have liked to have known who was going to be President, but it was getting to be a tedious affair.

When a boy was asked, "Where was the text this morning?" He replied, "It was somewhere in hatchets." "In hatchets? No, it was in Acts." "Well, I knew it was something that would cut," said the boy, triumphantly.

A stout German in the beer industry to an unprofitable customer: "Here, now, you took dose doors und walk owet mid your ears, eh? (He doesn't). "Heim, you don'd got out? Vell, you waits a minute und I gets a man dot vill!"

A negro held a cow while a cross-eyed man was to knock her on the head with an ax. The darkey, observing the man's eyes, in some alarm inquired, "You gwine to hit whar you look?" "Yes." "Den," said Cuffee, "hold dis cow yourself."

"What a strain that is!" said Mrs. Partington, as she heard an air from Lucia sung in the highest style by a young lady where she was visiting. "Yes," was the response; "it is operatic." "Upper attic, is it?" questioned she. "I should think it was high enough to be on top of the house."

Mistress: "Come, Bridget, how much longer are you going to be about filling that pepper-box?" Bridget (a fresh importation from where they don't use peper-castors): "Shure, ma'am, and it's meeself can't say how long it'll be takin' me to git all this stuff in the thing through the little holes in the top."

"What do you know about the prisoner?" asked the judge of a colored witness. "I don't know nothin' 'bout him, Judge, only he's bigoted!" "Bigoted?" asked the Judge; "what do you mean by bigoted?" "Why, Judge," explained the witness, "he knows too much for one niggah, and not nuff for two!"

A Round Story.—A man went through the Bankruptcy Court. He had owned a fine horse and gig, and they both disappeared for a time, but by-and-by the horse and gig were doing service for the same owner again. On being asked what this meant, the man's reply was, "I went through the Bankruptcy Court, but the horse and gig went round."

THE REASON.

Carrie.—"Mary, what have I done to offend you? You have avoided me the whole evening."

Mary.—"I'm not offinded. But your dress perfectly kills mine. And I really can't be seen with you!"

"OH! WHY
Should the Spirit of Mortal be Proud?"
This is a splendid specimen of book work, designed as a Holiday Gift, uniform in size, style and price, with
"NEARER, MY GOD, TO THEE,"
The daintiest Holiday Book of last year.
OH! WHY SHOULD THE SPIRIT OF MORTAL BE PROUD?
"It has an illustration, in the best style of the Art, with each verse of the poem. The verses might ere this have been forgotten were they not imperishably associated with the memory of a great man, and interwoven with the history of his greatest sorrow. The first love and affianced bride of our martyred President, Abraham Lincoln, died in the bloom of youth; and from that time he was often heard to repeat those wonderfully sad and impressive lines, expressive of the grief which lay with continual heaviness on his heart. He frequently repeated them aloud to his companions, even as late as his Presidency. We learn from the poet Bryant, in his Library of Poetry and Song, that this poem was a particular favorite of Mr. Lincoln. Mr. F. B. Carpenter, the artist, writes that while engaged in painting his picture at the White House he was alone one evening with the President in his room, when he said, 'There is a poem which has been a great favorite with me for years, which was first shown to me when a young man, by a friend, and which I afterwards saw and cut from a newspaper and learned by heart. I would,' he continued, 'give a great deal to know who wrote it, but have never been able to ascertain.' Either of these exquisite books, so appropriate as a gift from a parent to a child, or a child to a parent, from a brother to a sister, or a sister to a brother, or from one friend to another, may be obtained at the bookstores, or they will be sent, prepaid, at the very moderate price of Two Dollars Each." Will be sent upon application, a copy of their elegantly illustrated catalogue, giving full particulars of all their holiday publications by
LEE & SHEPARD.

FINE TEAS
This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.
We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY, (and allow no middlemen to make any profit on our importations,) which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only in large cities and among the very wealthy.
